# SinOne

# SC92F8547/8546/8543/8541

Super High-speed 1T 8051-based Flash MCU, 2 Kbytes SRAM, 32 Kbytes Flash, 128 bytes independent EEPROM, 31-channel high-sensitivity TouchKey module, 12-bit ADC, Analog Comparator, LCD/LED Driver, 12-bit PWM, 3 Timer/Counters, MDU, UART, SSI, CheckSum module

# 1 General Description

The SC92F8547/8546/8543/8541 (hereinafter referred to as the SC92F854X) is a kind of enhanced super high-speed 1T 8051-based industrial Flash Microcontroller unit (MCU), in which the instruction system is completely compatible with standard 8051 product series.

The SC92F854X contains 32K bytes Flash ROM, 2K bytes SRAM, 128 bytes EEPROM. The SC92F854X has built-in 31-channel high-sensitivity TouchKey circuit, up to 46 General-purpose I/Os (GPIO), 16 IO external interrupters, three 16-bit timers, 17-channel 12-bit high-precision ADC, 1 analog comparator, 8-channel independent 12-bit PWM, IO ports driven hierarchical control, 1 16*16-bit hardware Multiplier-Divide Unit (MDU). The system clock source is internal ±1% high-precision 16/8/4/1.33MHz high-frequency oscillator. The low-frequency clock source is selectable between the ±4% precision 128 kHz oscillator and external 32.768 kHz crystal oscillator, two SSI communication interface and other resources. To improve the reliability and simplify the circuit design, the SC92F854X also built in with 4-level optional LVR voltage, 2.4V ADC reference voltage, low-power WDT and other high-reliability circuits.

The SC92F854X features excellent anti-interference performance, which make it possible to be widely applied to industrial control system, such as Internet of Things, intelligent home appliances, home automation, wireless communication, gaming peripherals and consumer applications.

# 2 features

**Operating Voltage:** 2.4V ~ 5.5V

**Operating Temperature:** -40 ~ 85℃

**Package:**

SC92F8547 (LQFP48)

SC92F8546 (LQFP44)

SC92F8543 (SOP28/TSSOP28)

SC92F8541 (SOP16)

**Core:** Ultra-speed 1T 8051

**Flash ROM:** 32 Kbytes Flash ROM (MOVC prohibited addressing 0000H~00FFH 256 bytes)

**IAP:** Code option into 0K, 0.5K, 1K or 32K

**EEPROM:** 128 bytes EEPROM can be rewritten 100,000 times. The data written-in has more than 10-year preservation life.

**SRAM:** Internal 256 bytes + external 1792 bytes + PWM&LCD RAM 80 bytes

**System Clock (f$_{SYS}$):**

- Built-in 16 MHz high-speed RC oscillator (f$_{HRC}$):

- IC system clock can be set by the programmer as

  - 16 MHz @2.9~5.5V

  - 8/4/1.33 MHz@2.4~5.5V

- Frequency Error: Suitable for 3.0V ~ 5.5V and -20 ~ 85℃ application environment, no more than ±1%

**Built-in Low-speed Crystal Oscillator Circuit:**

- Available to externally connect 32K oscillator as Base Timer clock source, able to wake up STOP

**Built-in 128 kHz LRC Low-speed Oscillator:**

- Available to act as clock source of Base Timer (BTM) and WDT, which can wake up STOP

- Frequency Error: 4.0V ~ 5.5V and -20 ~ 85℃ application environment, no more than ±4% of frequency error after register correction

**Low-voltage Reset (LVR):**

- 4-level LVR voltage options: 4.3V, 3.7V, 2.9V, 2.3V

- The default is the Code Option value selected by the user

**Flash Programming and Emulation:**

- 2-wire JTAG programming and emulation interface

**Interruption (INT):**

- Totally 13 interrupt sources, including Timer0, Timer1, Timer2, INT0~2, ADC, PWM, UART, SSI, Base Timer, TK and CMP

- Three external interrupt vectors shared by 16 external interrupt I/Os, which can be defined in rising-edge, falling-edge or double-edge trigger mode.

- Two-level interrupt priority capability

**Digital Peripheral:**

- Up to 46 two-way independently controllable I/O interfaces, able to configure pull-high resistor independently

- P0~P3 (P3.0/1/2/3) 4-level control drive capability

- All IOs equipped with sink current drive capability (50mA)

- 11-bit WDT, optional clock division ratio

- 3 standard 80C51 timers: Timer0, Timer1 and Timer 2

- Eight 12-bit PWM output channels with variable period and individual duty cycle

- 1 independent UART communication port

- 1 UART/SPI/IIC communication interface (SSI)

- 16 * 16-bit hardware Multiplier-Divide Unit (MDU)

**LCD/LED Driver:**

- LCD/LED driver, select one from two, shared with common registers and IO interface

- 8 X 24, 6 X 26, 5 X 27 or 4X 28 segment LED drive

- LED segment interface with 4-level control drive capability

- 8 X 24, 6 X 26, 5 X 27 or 4 X 28 segment LCD drive

- **SC92F8541 without LCD/LED Driver**

**Analog Peripheral:**

- 31-channel high-sensitivity TK circuit

  - Feature 31-channel high-sensitivity TouchKeys and derivative functions

  - High-flexibility development with software library support to reduce development difficulty

  - Supporting automatic debugging software and intelligent development

- 17-channel 12-bit ±2LSB ADC

  - 17-channel 12-bit ±2LSB ADC

- Built-in 2.4V reference voltage

  - 2 options for ADC reference voltage: VDD and internal 2.4V

  - Internal one-channel ADC, where VDD can be measured directly

  - ADC conversion completion interrupt

- 1 analog comparator

  - 4-channel input and 1-channel reference voltage input

  - 16-level optional comparison voltage

**Power Saving Mode:**

- IDLE Mode: can be woken up by any interrupt.

- STOP Mode: can be woken up by INT0 ~ 2、 and Base Timer.

# Naming Rules for 92 Series Products

| Name | SC | 92 | F | 8 | 5 | 4 | 7 | X | P | 48 | R |
|---|---|---|---|---|---|---|---|---|---|---|---|
| S/R | ① | ② | ③ | ④ | ⑤ | ⑥ | ⑦ | ⑧ | ⑨ | ⑩ | ⑪ |

| S/R | Meaning |
|---|---|
| ① | SinOne Chip abbreviation |
| ② | Name of product series |
| ③ | Product Type (F: Flash MCU) |
| ④ | Serial Number: 7: GP Series, 8: TK series |
| ⑤ | ROM Size: 1 for 2K, 2 for 4K, 3 for 8K, 4 for 16K and 5 for 32K… |
| ⑥ | Subseries Number.: 0 ~ 9, A ~ Z |
| ⑦ | Number of Pins: 0: 8pin, 1: 16pin, 2: 20pin, 3: 28pin, 5: 32pin, 6: 44pin, 7: 48pin, 8: 64pin, 9: 100pin |
| ⑧ | Version Number: (default, B, C, D) |
| ⑨ | Package Type: (D: DIP; M: SOP; X: TSSOP; F: QFP; P: LQFP; Q: QFN; K: SKDIP) |
| ⑩ | Number of Pins. |
| ⑪ | Packaging Mode: (U: Tube; R: Tray; T: Reel) |

# 3 Pin Description

## 3.1 LQFP48/LQFP44 Pin Configuration

**Note:** **In consideration of multiplexing of TK9/TK11 and TK debugging communication ports of the SC92F854X, if it is required to use the TK debugging function, please avoid using TK9/TK11!**

Pin labels (top, pins 36–25):
- 36 P1.5/INT15/AIN1/S9/TK13
- 35 P1.4/INT14/AIN0/S8/TK12
- 34 P1.3/MOSI/SDA/TX1/S7/TK11/tDIO
- 33 P1.2/SCK/S6/TK10
- 32 P1.1/MISO/RX1/S5/TK9/tCK
- 31 P1.0/S4/TK8
- 30 P3.0/S3/C0/TK7
- 29 P3.1/S2/C1/TK6
- 28 P3.2/S1/C2/TK5
- 27 P3.3/S0/C3/TK4
- 26 P3.4/AIN8/C4/TK3
- 25 P3.5/AIN9/C5/TK2

Left side (pins 37–48):
- 37 TK14/S10/AIN2/INT16/P1.6
- 38 TK15/S11/AIN3/INT17/P1.7
- 39 TK16/S12/AIN4/RX0/INT20/P2.0
- 40 TK17/S13/AIN5/TX0/INT21/P2.1
- 41 TK18/S14/AIN6/INT22/P2.2
- 42 TK19/S15/AIN7/INT23/P2.3
- 43 TK20/S16/P2.4
- 44 TK21/S17/P2.5
- 45 TK22/S18/P2.6
- 46 TK23/S19/P2.7
- 47 TK24/S20/P0.0
- 48 TK25/S21/P0.1

Right side (pins 24–13):
- 24 P3.6/AIN10/C6/TK1
- 23 P3.7/AIN11/C7/TK0
- 22 P4.0/INT10/PWM40/CMP0/AIN12
- 21 P4.1/INT11/PWM41/CMP1/AIN13
- 20 P4.2/INT12/PWM42/CMP2/AIN14
- 19 P4.3/INT13/PWM43/CMP3/AIN15
- 18 P4.4/CMPR
- 17 P4.5
- 16 VDD
- 15 P4.6
- 14 P4.7
- 13 P5.5

Bottom (pins 1–12):
- 1 TK26/S22/T0/P0.2
- 2 TK27/S23/T1/P0.3
- 3 TK28/S24/T2EX/INT04/P0.4
- 4 TK29/S25/T2/INT05/P0.5

# 4 Inner BLOCK Diagram

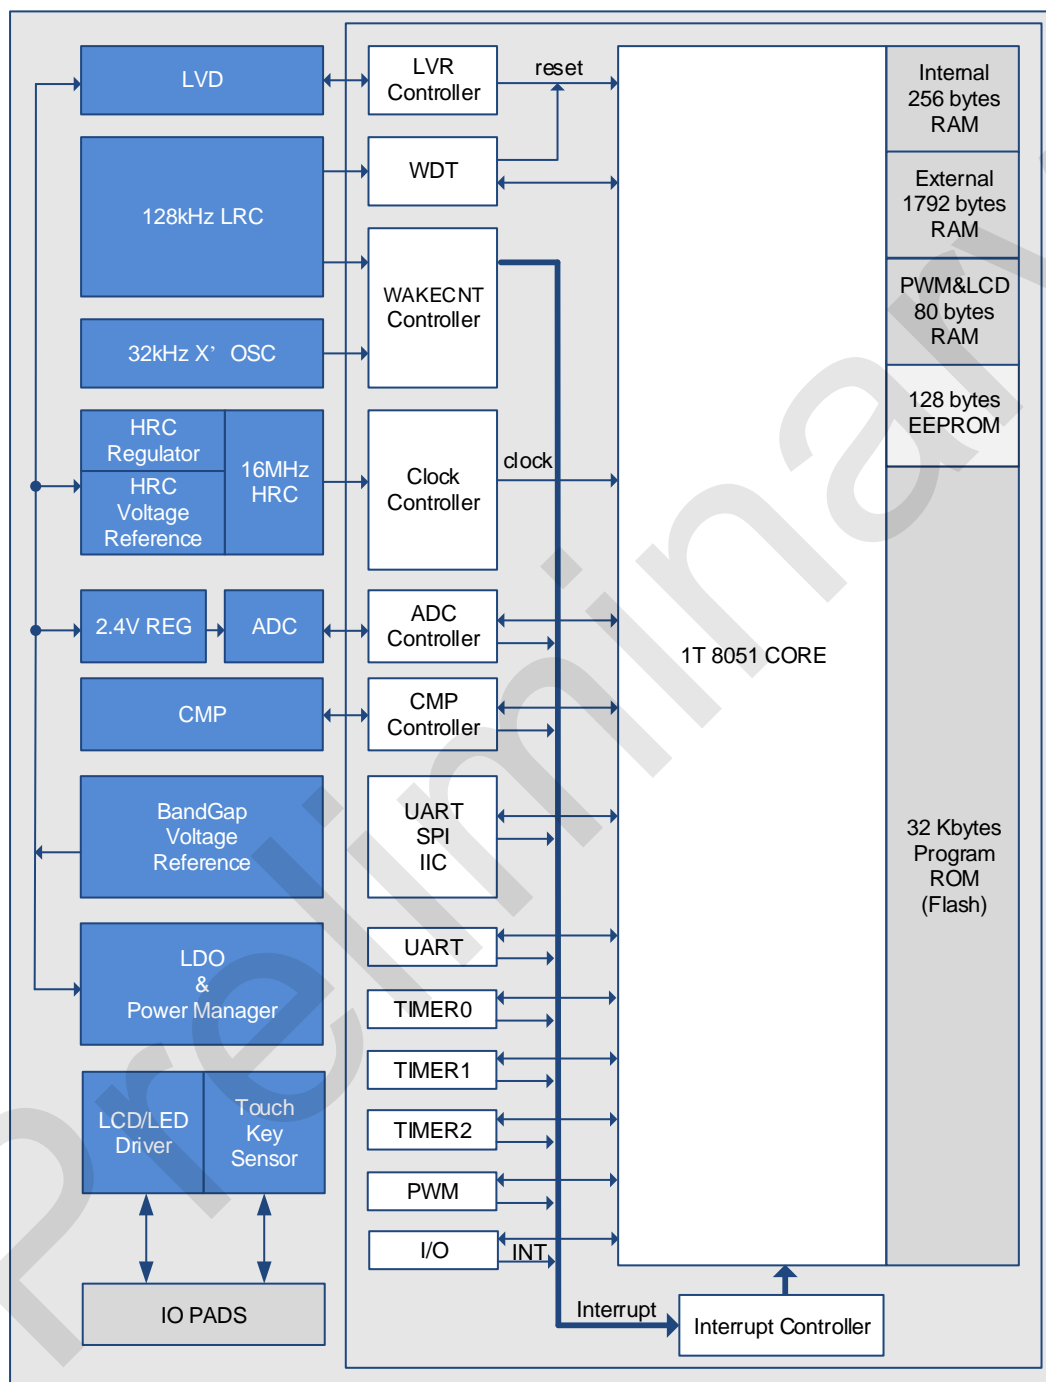

SC92F854X BLOCK DIAGRAM

# 5 Flash ROM and SRAM Structure

The structures of the SC92F854X's Flash ROM and SRAM are shown as follows:

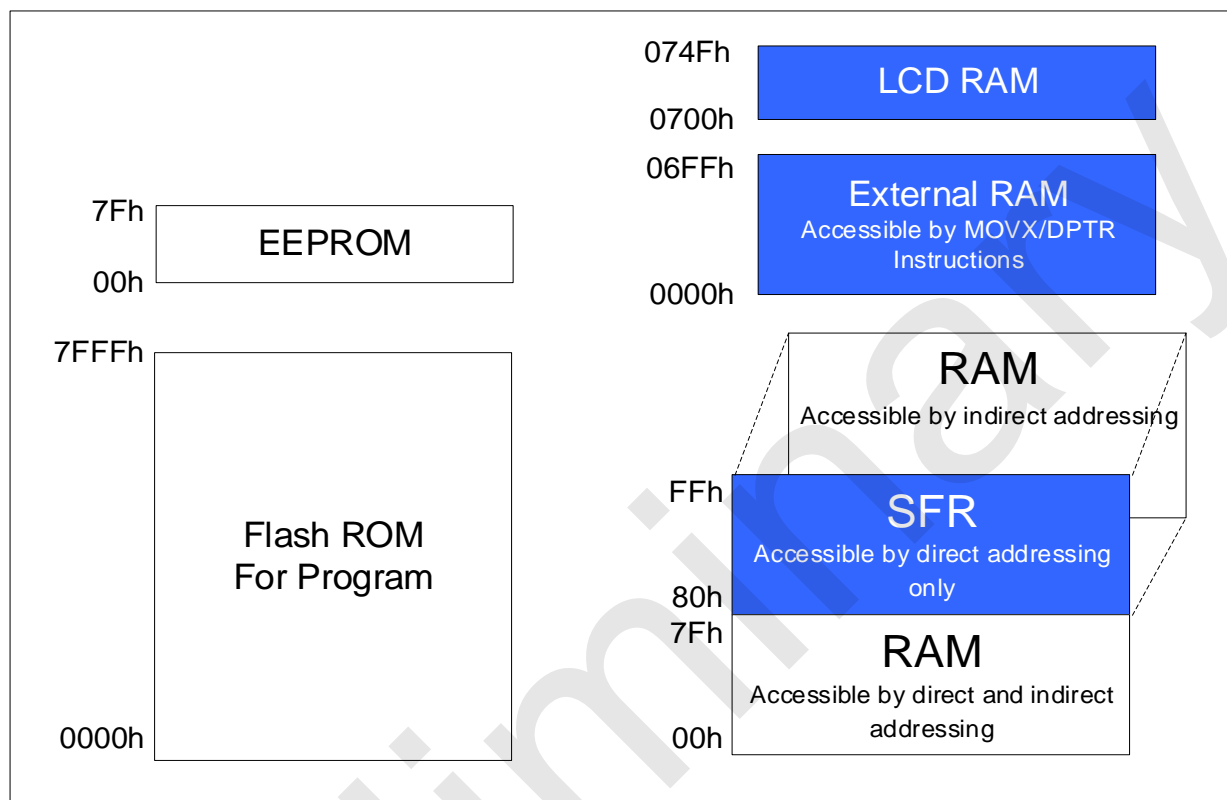

Flash ROM and SRAM Structure Diagram

## 5.1 flash rom

The SC92F854X provides 32 Kbytes of Flash ROM with the ROM address of 0000H ~ 7FFFH. These 32 Kbytes of Flash ROM can be rewritten 10,000 times, which is able to program and erase by specialized ICP programming device (SOC PRO52/DPT52/SC LINK) provided by SinOne.

The MOVC instruction is non-addressable within 256 bytes (address of 0000H ~ 00FFH). That is to say, the user code unable to read the contents of the 256 bytes region that ensures that the encryption function of chip program. For more details, refer to "SinOne SC92F Series MCU Application Guide".

EEPROM is an data memory separated from 32K bytes ROM with the address of 00H ~ 7FH, which can be accessed by single-byte reading and writing operations in the program; for more details, refer to 21 EEPROM and IAP Operations.

 **Note: The EEPROM can be rewritten 100,000 times. Users cannot exceed the limit value, otherwise there will be an exception!**

The SC92F854X 32 Kbytes Flash ROM provide Empty Check, Program, Verify and Erase function other than Read function. This Flash ROM and EEPROM usually needs no Erase operation before writing. Directly writing data can realize coverage of new data.

The SC92F854X Flash ROM can be programmed by tDIO, tCK, VDD and VSS, with its specific connection shown

as follows:

ICP Mode Flash Writer Programming Connection Diagram

## 5.2 Customer Option Memory (User Programming Setting)

A separate Flash data memory is embedded inside the SC92F854X, called Code Option area, to save the user's presets. These presets will be written into IC when programming and loaded into SFR as default values during reset.

Option-related SFR Operating Instructions:

Reading and writing operations to option-related SFR are controlled by both register OPINX and register OPREG, with its respective address of Option SFR depending on register OPINX, as shown below:

| Symbol | Address | Description | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|
| OP_HRCR | 83H@FFH | System Clock Change Register | | | | OP_HRCR[7: 0] | | | | |

## 5.2.1 Customer-Option-related Registers Operation Instructions

Option-related SFRs reading and writing operations are controlled by both OPINX and OPREG registers, with their respective position of Option SFR depending on OPINX and its value written to option-related SFR depending on register OPREG:

| Symbol | Address | Description | | POR |
|---|---|---|---|---|
| OPINX | FEH | Option Pointer | OPINX[7: 0] | 00000000b |
| OPREG | FFH | Option Register | OPREG[7: 0] | nnnnnnnnb |

When operating Option-related SFRs, register OPINX stores the address of option-related registers and register OPREG stores corresponding value.

For Example: To configure OP_HRCR as 0x01, specific operation method is shown below:

C program example:

OPINX = 0x83;                //Write OP_HRCR address into OPINX register

OPREG = 0x01;                //Write 0x01 into OPREG register (the value to be written into OP_HRCR register)

Assembler program example:

MOV OPINX, #83H;                //Write OP_HRCR address into OPINX register

MOV OPREG, #01H;                //Write 0x01 into OPREG register (the value to be written into OP_HRCR register)

**Note:   It is forbidden to write any value beyond SFR address of Customer Option region into OPINX register! Or else, it may cause abnormal system operation.**

## 5.3 SRAM

The SRAM of the SC92F854X is divided into internal 256 bytes RAM, external 1792 bytes RAM and 80 bytes PWM&LCD RAM. The address of Internal RAM range from 00H to FFH, including high 128 bytes (address of from80H to FFH) only addressed indirectly and low 128 bytes (address of from 00H to 7FH) addressed both directly and indirectly).

The address of SFRs are also from 80H to FFH. The difference between SFR and internal high 128 bytes SRAM is that the former is addressed directly but the latter addressed indirectly only.

The address of External RAM from 0000H to 06FFH, which can be accessible by MOVX instruction.

### 5.3.1 Internal 256 bytes SRAM

Internal low 128 bytes SRAM area is divided into three parts:

1.   Register bank 0 ~ 3, address from 00H to 1FH. The RS1 and RS0 of PSW register can select the currently active SFR. Using Register bank 0 ~ 3 can accelerate arithmetic speed;

2.   Bit addressing area , 20H ~2FH; user can use it as normal RAM or bitwise addressing RAM; for the latter, the bit address is from 00H to 7FH (bitwise addressing is different from normal SRAM byte-oriented addressing), which can be distinguished by instructions in program;

3.   User RAM and stack area, the 8-bit stack pointer will point to stack area after the SC92F854X reset; in general, users can set initial value in initializer, it is recommended to configure in the unit interval from E0H to FFH.

| | | |
|---|---|---|
| FFH | | FFH |
| High 128 bytes RAM<br>Accessible by indirect addressing only | | SFR<br>Accessible by direct addressing |
| 80H | | 80H |

7FH

Low 128 bytes RAM
Accessible by direct and indirect
addressing

00H
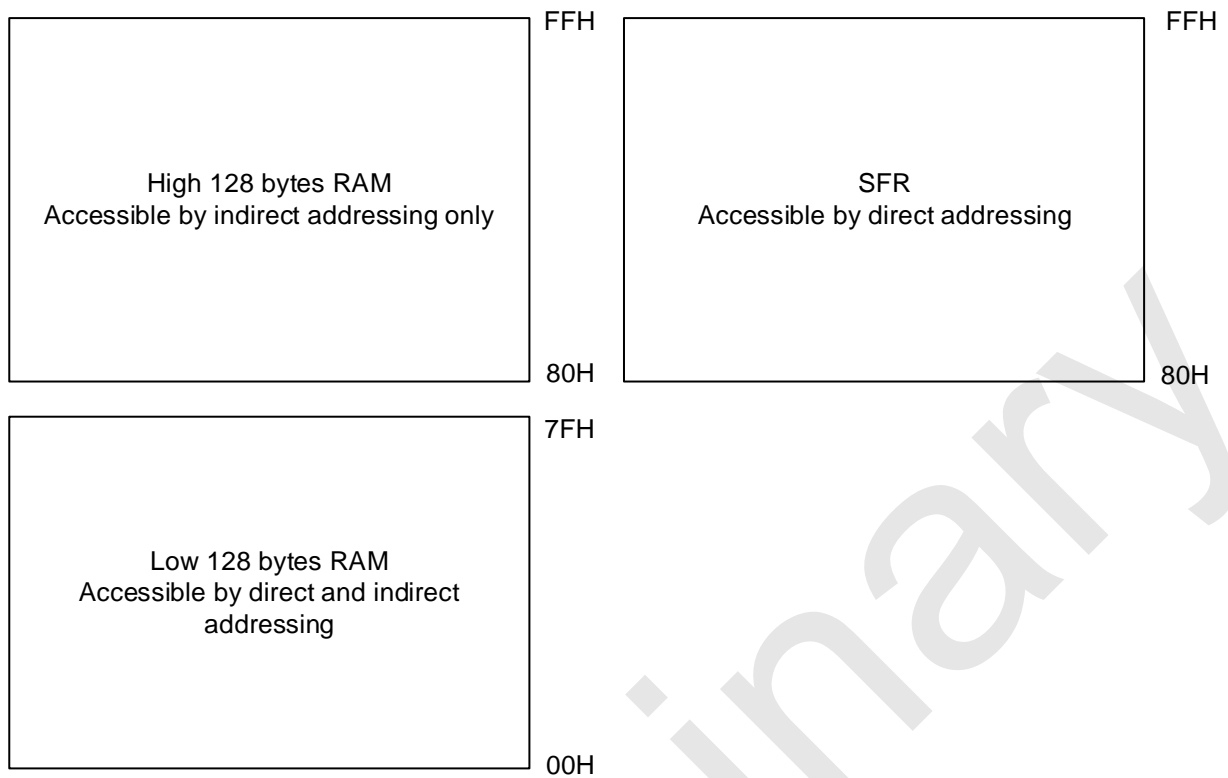

Internal 256 bytes RAM Structure Diagram

Internal low 128 bytes RAM structure is shown below:
SRAM Structure Diagram

## 5.3.2 External 1792 bytes SRAM

The external 1792 bytes RAM (SRAM) can be accessed by instruction ''MOVX @DPTR'' or instruction MOVX A ,@Ri or MOVX @Ri,A together whit EXADH register. EXADH register stores high address of external SRAM; Ri register stores low 8-bit address of external SRAM.

**EXADH (F7H) External SRAM Operating Address High (Read/Write)**

| Bit Number | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit Mnemonic | - | - | - | - | - | EXADH [2:0] | | |
| POR | x | x | x | x | x | 0 | 0 | 0 |

| Bit Number | Bit Mnemonic | Description |
|---|---|---|
| 2 ~ 0 | **EXADH [2: 0]** | External SRAM Address High position |
| 7 ~ 2 | - | Reserved |

### 5.3.3 PWM&LCD 80 bytes SRAM

The 0700H~074FH of RAM address is the PWM&LCD SRAM of 80 bytes, where:

1. PWM duty cycle adjustment register occupies 0740H~074FH and is only writable and unreadable. Refer to the 13.2 PWM related SFR register for specific operation methods.

2. LCD/LED display RAM occupies 0700H~071BH. Refer to 15.2 LCD/LED display RAM configuration for specific operation methods.

# 6 Special Function Register (SFR)

## 6.1 SFR Mapping

The SC92F854X provides some registers equipped with special functions, called SFR. The address of such SFRs is from 80H to FFH, some are bit-addressable, and others are not. It is very convenient for these bit addressable registers to change the value of single bit, of which the address is end up with figure "0" or "8". All SFR shall use direct addressing for addressing.

The name and address of the SC92F854X special function registers are shown in the table below:

| | 0/8 | 1/9 | 2/A | 3/B | 4/C | 5/D | 6/E | 7/F |
|---|---|---|---|---|---|---|---|---|
| F8h | - | - | - | - | CHKSUML | CHKSUMH | OPINX | OPREG |
| F0h | B | IAPKEY | IAPADL | IAPADH | IAPADE | IAPDAT | IAPCTL | EXADH |
| E8h | - | EXA0 | EXA1 | EXA2 | EXA3 | EXBL | EXBH | OPERCON |
| E0h | ACC | - | - | - | - | - | - | - |
| D8h | P5 | P5CON | P5PH | - | - | - | - | - |
| D0h | PSW | - | - | PWMCON | PWMCFG | | | |

| C8h | T2CON | T2MOD | RCAP2L | RCAP2H | TL2 | TH2 | BTMCON | WDTCON |
|---|---|---|---|---|---|---|---|---|
| C0h | P4 | P4CON | P4PH | - | - | - | INT2F | INT2R |
| B8h | IP | IP1 | INT0F | INT0R | INT1F | INT1R | - | - |
| B0h | P3 | P3CON | P3PH | P3VO | - | - | CMPCFG | CMPCON |
| A8h | IE | IE1 | ADCCFG2 | ADCCFG0 | ADCCFG1 | ADCCON | ADCVL | ADCVH |
| A0h | P2 | P2CON | P2PH | P2VO | - | - | - | - |
| 98h | SCON | SBUF | P0CON | P0PH | P0VO | SSCON0 | SSCON1 | SSDAT |
| 90h | P1 | P1CON | P1PH | DDRCON | P1VO | SSCON2 | IOHCON0 | IOHCON1 |
| 88h | TCON | TMOD | TL0 | TL1 | TH0 | TH1 | TMCON | OTCON |
| 80h | P0 | SP | DPL | DPH | - | - | - | PCON |
| | Bit Addressable | Not Bit Addressable | | | | | | |

**Notes:**

1. The hollow spaces in the table above means that there is no such register RAM, which is not recommended for users.

2. The address of SFR for system configuration is F1H ~ FFH, user use it may result in system exceptions. Users are not allowed to conduct clearing or other operations to these registers during the system initialization process.

## 6.2 SFR Instructions

For details on each SFR, see the following table:

| Mnemonic | Add | Description | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | POR |
|---|---|---|---|---|---|---|---|---|---|---|---|
| P0 | 80H | P0 Data Register | P07 | P06 | P05 | P04 | P03 | P02 | P01 | P00 | 00000000b |
| SP | 81H | Stack Pointer | SP[7:0] | | | | | | | | 00000111b |
| DPL | 82H | Data Pointer Low byte | DPL[7:0] | | | | | | | | 00000000b |
| DPH | 83H | Data Pointer High byte | DPH[7:0] | | | | | | | | 00000000b |

| Name | Addr | Description | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 | Reset |

## 6.2.1 C51 Core SFRs

### Program Counter (PC)

PC does not belong to SFR .16-bit PC is the register used to control instruction execution sequence. After power-on or reset of microcontroller unit, PC value is 0000H, that is to say, the microcontroller unit is to execute program from 0000H.

### Accumulator ACC (E0H)

Accumulator ACC is one of the commonly-used registers in 8051-based microcontroller unit, using A as mnemonic symbol in the instruction system. It is usually used to store operand and results for calculation or logical operations.

### B Register (F0H)

B Register shall be used together with Accumulator A in multiplication and division operations. For example, instruction "MUL A, B" is used to multiply 8-bit unsigned numbers of Accumulator A and Register B. As for the acquired 16-bit product, low byte is placed in A and High byte in B. As for "DIV A, B" is used to divide A by B, place integer quotient in A and remainder in B. Register B can also be used as common temporary register.

### Stack Pointer SP (81H)

Stack pointer is an 8-bit specialized register, it indicates the address of top stack in common RAM. After resetting of microcontroller unit, the initial value of SP is 07H, and the stack will increase from 08H. 08H ~ 1FH is address of register banks 1 ~ 3.

### PSW (D0H) Program Status Word Register (Read/Write)

| Bit Number | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit Mnemonic | CY | AC | F0 | RS1 | RS0 | OV | F1 | P |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| POR | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit Number | Bit Mnemonic | Description |
|---|---|---|
| 7 | **CY** | Carry Flag bit<br><br>1: The top digit of add operation has carry bit or the top digit of subtraction operation has the borrow digit<br><br>0: The top digit of add operation has no carry bit or the top digit of subtraction operation has no borrow digit |
| 6 | **AC** | Carry-bit auxiliary flag bit (adjustable upon BCD code add and subtraction operations)<br><br>1: There is carry bit in bit 3 upon add operation and borrow bit in bit 3 upon subtraction operation<br><br>0: No borrow bit and carry bit |
| 5 | **F0** | User flag bit |
| 4 ~ 3 | **RS1、RS0** | Register banks selection bits<br><br>| RS1 | RS0 | Current Selected Register banks 0 ~ 3 |<br>|---|---|---|<br>| 0 | 0 | Group 0 (00H ~ 07H) |<br>| 0 | 1 | Group 1 (08H ~ 0FH) |<br>| 1 | 0 | Group 2 (10H ~ 17H) |<br>| 1 | 1 | Group 3 (18H ~ 1FH) | |
| 2 | **OV** | Overflow flag bit |
| 1 | **F1** | F1 flag bit<br><br>User customized flag |
| 0 | **P** | Parity flag bit. This flag bit is the parity value of the number of 1 in accumulator ACC.<br><br>1: Odd number of number of 1 in ACC<br><br>0: Even number of number of 1 in ACC (including 0) |

**Data Pointer DPTR (82H, 83H)**

The Data pointer DPTR of SC92F854X is a 16-bit dedicated register, which is composed of Low byte DPL (82H) and High byte DPH (83H). DPTR is a register that can directly conduct 16-bit operation, which can also conduct operations on DPL and DPH by byte.

# 7 Power, Reset and System Clock

## 7.1 Power Circuit

The SC92F854X Power includes circuits such as BG, LDO, POR and LVR, which are able to reliably work within the scope of 2.4V ~ 5.5V. Besides, a calibrated 2.4V reference is build in the IC, which is used as ADC internal reference voltage. The user can search for specific configuration contents in 18 Analog-to-digital converter (ADC).

## 7.2 Power-on Reset

After the SC92F854X power-on, the processes carried out before execution of client software are as follows:

- Reset stage

- Loading information stage

- Normal operation stage

### 7.2.1 Reset Stage

The SC92F854X will always be in reset mode. There will not be a valid clock until the voltage supplied to the SC92F854X is higher than certain voltage. The duration of reset stage is related to rising speed of external power. Once the external supply voltage is up to built-in POR voltage, the reset stage would be completed.

### 7.2.2 Loading Information Stage

There is a preheating counter inside the SC92F854X. During the reset stage, this preheating counter is always reset as zero. After the voltage is higher than POR voltage, internal RC oscillator starts to oscillate and this preheating counter starts to count. When internal preheating counter counts up to certain number, one byte data will be read from IFB of Flash ROM (including Code Option) for every certain number of HRC clock, which is saved to internal system registers. After the preheating is completed, such reset signal will end.

### 7.2.3 Normal Operating Stage

After the loading information stage has been completed, the SC92F854X starts to read instruction code from Flash and enters normal operating stage. At this time, LVR voltage is the set value of Code Option written by user.

## 7.3 Reset Modes

The SC92F854X has 4 kinds of reset modes: ① External RST reset ②Low-voltage reset (LVR) ③Power-on reset (POR) ④Watchdog (WDT) reset.

### 7.3.1 External Reset

External reset is to supply a certain width reset pulse signal to the SC92F854X from the RST pin to realize the SC92F854X reset.

User can configure P5.2 pin as RST (reset pin) in Customer Option via PC program software before programming.

### 7.3.2 Low-voltage Reset (LVR)

The SC92F854X provides a low-voltage reset circuit. There are 4-level LVR voltage options: 4.3V, 3.7V, 2.9V and 2.3V. The default is the Option value written by user.

**OP_CTM0(C1H@FFH) Customer Option Register 0 (Read/Write)**

| Bit Number | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

The Circuit Diagram of the SC92F854X Resetting Part is shown below:
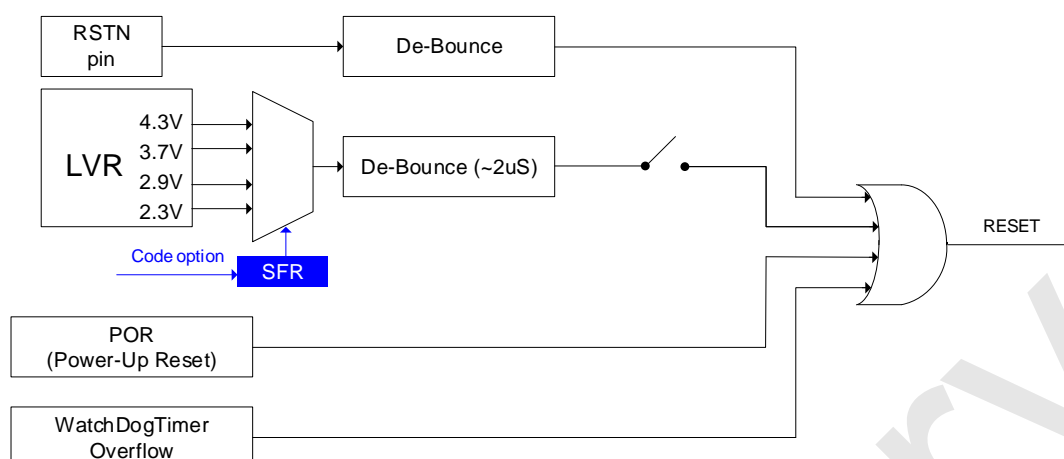

The SC92F854X Reset Diagram

## 7.3.3 Power-on Reset (POR)

The SC92F854X provides a power-on reset circuit. When power voltage V$_{DD}$ is up to POR reset voltage, the system will be reset automatically.

## 7.3.4 Watchdog Reset (WDT)

The SC92F854X has a WDT, the clock source of which is the internal 128 kHz oscillator. User can select whether to enable Watchdog Reset function by programmer Code Option.

**OP_CTM0 (C1H@FFH) Customer Option Register 0 (Read/Write)**

| | | 111 | 3.94ms | |
|---|---|---|---|---|
| 7 ~ 5, 3 | - | Reserved | | |

### 7.3.5 Register Reset Value

During reset, most registers are set to their initial values and the WDT remains disable. The initial value of program counter (PC) is 0000h, and the initial value of stack pointer SP is 07h. Reset of "Hot Start" (such as WDT, LVR, etc.) will not influence SRAM which always keep the value before resetting. The SRAM contents will be retained until the power voltage is too low to keep RAM alive.

The initial value of power-on reset in SFRs is shown in the table below:

| Mnemonic | Reset value | Mnemonic | Reset value |
|---|---|---|---|
| ACC | 00000000b | P1VO | 00000000b |

# 7.4 High-speed RC Oscillator

The SC92F854X has a built-in adjustable high-precision HRC. HRC is precisely calibrated to 16 MHz@5V/25℃ when delivery. The user can set system clock as 16/8/4/1.33MHz by programmer Code Option. The calibration process is to filter the influence of processing deviation on precision. There will be certain drifting of this HRC depending on operating temperature and voltage. As for voltage drifting (3.0V ~ 5.5V) and temperature drifting (-20℃ ~ 85℃), the deviation is within ±1%.

**Note:** **The clock source of ADC and TouchKey circuit is $f_{HRC}$ = 16MHz, which is independent of switch of system clock.**

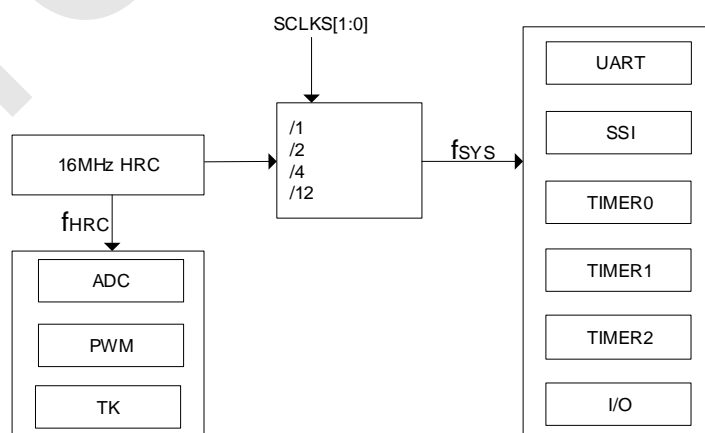

The SC92F854X Internal Clock Relationship

| 7~0 | **OP_HRCR[7:0]** | **HRC frequency change register**<br><br>User can change high-frequency oscillator frequency $f_{HRC}$ by modifying the value of this register, and then change the IC system clock frequency $f_{SYS}$:<br><br>1. Initial value OP_HRCR[s] after OP_HRCR[7: 0] power-on is a fixed value, which guarantee $f_{HRC}$ is 16MHz, there may be difference in OP_HRCR[s] of each IC<br><br>2. When initial value is OP_HRCR[s], IC system clock frequency $f_{SYS}$ can set specifically as 16/8/4/1.33MHz by Option. For each change of 1 for OP_HRCR [7: 0], the change of $f_{SYS}$ frequency is about 0.23%.<br><br>The relationship between OP_HRCR [7: 0] and output frequency $f_{SYS}$ is shown as follows: |

| OP_HRCR [7:0] | $f_{SYS}$ actual output frequency (taking 16M as an example) |
|---|---|
| OP_HRCR [s]-n | 16000*(1-0.23%*n)kHz |
| ... | .... |
| OP_HRCR [s]-2 | 16000*(1-0.23%*2) = 15926.4kHz |
| OP_HRCR [s]-1 | 16000*(1-0.23%*1) = 15963.2kHz |
| OP_HRCR [s] | 16000kHz |
| OP_HRCR [s]+1 | 16000*(1+0.23%*1) = 16036.8kHz |
| OP_HRCR [s]+2 | 16000*(1+0.23%*2) = 16073.6kHz |
| ... | ... |
| OP_HRCR [s]+n | 16000*(1+0.23%*n)kHz |

**Notes:**

1. **The value of OP_HRCR[7:0] after each power-on of the IC is the value of high-frequency oscillator frequency $f_{HRC}$ closest to 16MHz; the user can modify the value of HRC after each power-on by means of EEPROM to make IC system clock frequency $f_{SYS}$ work at the frequency the user needs.**

2. **To guarantee IC operating reliably, the maximum operating frequency of IC shall not exceed 10% of 16MHz, which is 17.6MHz;**

3. **The user shall confirm the change of HRC frequency will not influence other functions.**

## 7.5 Low-speed RC Oscillator and Low-speed Clock Timer

The SC92F854X is equipped with a built-in 128 kHz RC oscillation circuit and a 32.768k Hz crystal oscillation circuit, which can be set as clock source of low-frequency clock timer Base Timer. This oscillator is directly connected to Base Timer , which can wake up CPU from STOP mode and generate interrupt.

32KHz external crystal connecting circuit diagram

The selection relation diagram of internal and external oscillations of the Base Timer is as follows:

Base Timer block
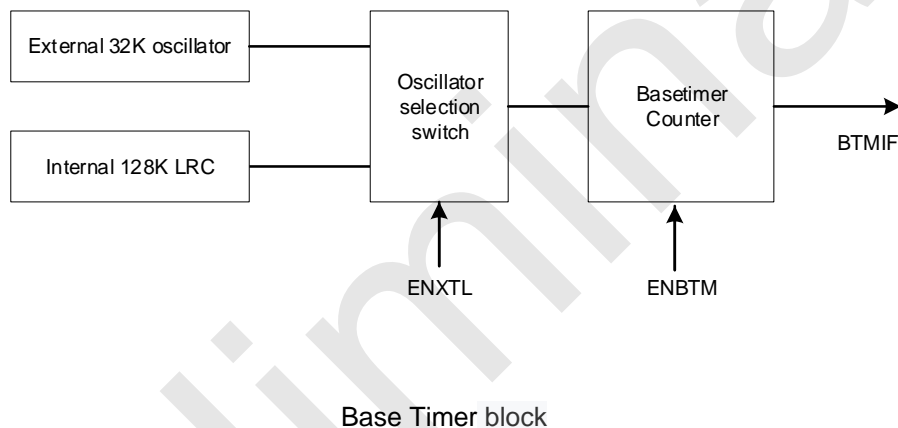

# 7.6 STOP Mode and IDLE Mode

The SC92F854X provides a SFR PCON, the user can configure bit 0 and bit 1 of this register to control MCU to enter different operating modes.

When PCON.1 = 1, internal high-frequency system clock would stop and system enter STOP mode, to save power. The system can be woken up from STOP by external interrupt INT0 ~ INT2, low-frequency clock interrupt, WDT, and external reset input.

When PCON.0 = 1, the program would stop running and System enter IDLE mode. But the external equipment and clock will continue running, CPU will keep all states before entering IDLE mode. The system can be woken up from IDLE by any interrupt.

**PCON (87H) Power Management Control Register (only for write, \*unreadable\*)**

| Bit Number | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit Mnemonic | SMOD | - | - | - | - | - | STOP | IDL |

| R/W | W | - | - | - | - | - | W | W |
|-----|---|---|---|---|---|---|---|---|
| POR | 0 | x | x | x | x | x | 0 | 0 |

| Bit Number | Bit Mnemonic | Description |
|------------|--------------|-------------|
| 1 | **STOP** | STOP mode control bit<br><br>0: normal operating mode<br><br>1: stop mode, high-frequency oscillator stops operating, low-frequency oscillator and WDT can select to work based on configuration |
| 0 | **IDL** | IDLE mode control bit<br><br>0: normal operating mode<br><br>1: IDLE mode, the program stops operating, but external equipment and clock continue to operate and all CPU states are saved before entering IDLE mode |

**Notes: When Configure MCU to enter STOP or IDLE mode, the instruction of configuring PCON register should be followed by 8 "NOP" instructions rather than other instructions. Or else, it will be unable to execute following instructions normally after wake-up!**

For example, configure MCU to enter STOP mode:

C program example:

#include"intrins.h"

    PCON |= 0x02;          //Set to 1 for PCON bit1 STOP bit, configure MCU to enter STOP mode

    _nop_ ();              //At least 8 _nop_ () required

    _nop_ ();

    _nop_ ();

    _nop_ ();

    _nop_ ();

    _nop_ ();

    _nop_ ();

    ……

Assembly program example:

ORL PCON, #02H   ; Set to 1 for PCON bits1 STOP bit, configure MCU to enter STOP mode

NOP                     ; At least 8 NOP required

# 8 CPU and Function System

## 8.1 CPU

CPU used by the SC92F854X is the high-speed 1T standard 8051 core, whose instructions are completely compatible with traditional 8051 core microcontroller unit.

## 8.2 Addressing Mode

The addressing mode of the SC92F854X 1T 8051 CPU instructions includes: ①Immediate Addressing ② Direct Addressing ③ Indirect Address ④ Register Addressing ⑤ Relative Addressing ⑥ Indexed Addressing ⑦ Bit Addressing

### 8.2.1 Immediate Addressing

Immediate addressing is also called immediate operand addressing, which is the operand given to participate in operation in instruction, the instruction is illustrated as follows:

MOV A, #50H (This instruction is to move immediate operand 50H to Accumulator A)

### 8.2.2 Direct Addressing

In direct addressing mode, the instruction operand field indicates the address to participate in operation operand. Direct addressing can only be used to address SFRs, internal data registers and bit address space. The SFRs and bit address space can only be accessed by direct addressing. For example:

ANL 50H, #91H (The instruction indicates the data in 50H unit AND immediate operand 91H, and the results are stored in 50H unit. 50H refers to direct address, indicating one unit in internal data register RAM.)

### 8.2.3 Indirect Addressing

Indirect addressing is expressed as adding "@" before R0 or R1. Suppose the data in R1 is 40H and the data of internal data register 40H unit is 55H, then the instruction will be

   MOV A, @R1 (Move the data 55h to Accumulator A).

### 8.2.4 Register Addressing

Register addressing is to operate the data in the selected registers R7 ~ R0, Accumulator A, general-purpose register B, address registers and carry bit C. The registers R7-R0 is indicated by lower 3 bits of instruction code. ACC, B, DPTR and carry bit C are implied in the instruction code. Therefore, register addressing can also include an implied addressing mode. The selection of register operating area depends on RS1 and RS0 of PSW. The registers indicated by instruction operand refers to the registers in current operating area.

   INC R0      refers to (R0) +1→R0

### 8.2.5 Relative Addressing

The data in the second byte of the instruction, whose result shall be taken as the jump address of jump instruction. The Jump address is the target jump address, the current value in PC is the base address and the data in the

second byte of the instruction is the offset address. Because the target jump address is relative to base address in PC, such addressing mode is called relative addressing. The offset is signed number, which ranges from +127 to -128, such addressing mode is mainly applied to jump instruction.

JC ＄+50H

It indicates that if the carry bit C is 0, the contents in program counter PC remain the same, meaning no jump. On the contrary, if the carry bit C is 1, take the sum of the current value in PC and base address as well as offset 50H as the target jump address of this jump instruction.

## 8.2.6 Indexed Addressing

In indexed addressing mode, the instruction operand is to develop an indexed register to store indexed base address. Upon indexed addressing, the result by adding offset and indexed base address is taken as the address of operation operand. The indexed registers include PC and address register DPTR.

MOVC A, @A+DPTR

It indicates Accumulator A is used as offset register. Take the sum of the value in A and that in the address register DPTR as the address of operand. Then take the figure in the address out and transmit it to Accumulator A.

## 8.2.7 Bits Addressing

Bit addressing is a kind of addressing mode when conducting bit operation on internal data storage RAM and SFRs which are able to carry out bit operations. Upon bit operations, by taking carry bit C as bit operation accumulator, the instruction operand will give the address of this bit directly, then execute bit operation based on the nature of operation code.

MOV C, 20H (Transmit the bit operation register with address of 20H into carry bit C)

# 9 Interrupt

The SC92F854X provides 13 interrupt sources: Timer0, Timer1, Timer2, INT0 ~ 2, ADC, PWM, UART, SSI, Base Timer,TK and CMP. These 13 interrupt sources are equipped with 2-level interrupt priority capability and each interrupt source can be individually configured in high priority or low priority. As for three external interrupts, the triggering condition of each interrupt source can be set as rising edge, falling edge or dual-edge trigger. Each interrupt is equipped with independent priority setting bit, interrupt flag, interrupt vector and enable bit. Global interrupt enable bit EA can enable or disable all interrupts.

## 9.1 Interrupt Source and Vector

Lists for the SC92F854X interrupt source, interrupt vector and related control bit are shown below:

| Interrupt Source | Interrupt condition | Interrupt Flag | Interrupt Enable Control | Interrupt Priority Control | Interrupt Vector | Query Priority | Interrupt Number (C51) | Flag Clear Mode | Capability of Waking up STOP |
|---|---|---|---|---|---|---|---|---|---|
| INT0 | Compliant with External interrupt 0 conditions | IE0 | EINT0 | IPINT0 | 0003H | 1 (high) | 0 | H/W Auto | Yes |
| Timer0 | Timer0 overflow | TF0 | ET0 | IPT0 | 000BH | 2 | 1 | H/W Auto | No |
| INT1 | Compliant with External interrupt 1 conditions | IE1 | EINT1 | IPINT1 | 0013H | 3 | 2 | H/W Auto | Yes |
| Timer1 | Timer1 overflow | TF1 | ET1 | IPT1 | 001BH | 4 | 3 | H/W Auto | No |
| UART | Receiving or transmitting completed | RI/TI | EUART | IPUART | 0023H | 5 | 4 | Must be cleared by user | No |
| Timer2 | Timer2 overflow | TF2 | ET2 | IPT2 | 002BH | 6 | 5 | Must be cleared by user | No |
| ADC | ADC conversion completed | ADCIF | EADC | IPADC | 0033H | 7 | 6 | Must be cleared by user | No |
| SSI | Receiving or transmitting completed | SPIF/TWIF | ESSI | IPSPI | 003BH | 8 | 7 | Must be cleared by user | No |
| PWM | PWM overflow | PWMIF | EPWM | IPPWM | 0043H | 9 | 8 | Must be cleared by user | No |
| BTM | Base timer overflow | BTMIF | EBTM | IPBTM | 004BH | 10 | 9 | H/W Auto | Yes |
| INT2 | External interrupt 2 conditions | - | EINT2 | IPINT2 | 0053H | 11 | 10 | - | Yes |

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | compliant | | | | | | | | |
| TK | TouchKey counter overflow | TKIF | ETK | IPTK | 005BH | 12 | 11 | H/W Auto | No |
| CMP | Comparator interrupt conditions compliant | CMPIF | ECMP | IPCMP | 0063H | 13 | 12 | Must be cleared by user | Yes |

Under the circumstance where the master interrupt control bit EA and the respective interrupt control bit have been enable, the interrupt occurrence is shown below:

**Timer Interrupt:** Interrupt generates when Timer0 or Timer1 overflows and the interrupt flag TF0 or TF1 is set to "1". When the microcontroller unit responds to the timer interrupt, the interrupt flag TF0 or TF1 is reset automatically by hardware. Interrupt generates when Timer2 overflows and the interrupt flag TF2 is set to "1". Once Timer2 interrupt generates, the hardware would not automatically clear TF2 bit, which must be cleared by the user's software.

**UART Interrupt:** When UART0 completes receiving or transmitting a frame of data, bit RI or TI will be set to "1" automatically by hardware, and UART interrupt occurs. Once UART interrupt occurs, the hardware would not automatically clear up RI/TI bit, which shall be cleared by user's software.

**ADC Interrupt:** After ADC conversion is completed, ADC interrupt generates, whose interrupt flag is the ADC conversion completion flag EOC/ADCIF (ADCCON.5). When user starts ADCS conversion, EOC will be reset automatically by hardware. Once conversion completes, EOC would be set to "1" automatically by hardware. User should clear the ADC interrupt flag by software when the interrupt service routine is executed after ADC interrupt generates.

**SSI Interrupt:** When SSI completes receiving or transmitting a frame of data, SPIF/TWIF bit will be set to "1" automatically by hardware, and SSI interrupt generates. When the microcontroller unit serves SSI interrupt, the interrupt flag SPIF/TWIF must be cleared by software.

**PWM Interrupt:** When PWM counter overflows (beyond PWMPD), the flag will be set as 1 automatically by hardware. Meanwhile, if the PWM interrupt control bit IE1[1] (EPWM) is set as 1, PWM interrupt will occurs. Once PWM interrupt occurs, the hardware would not clear the interrupt flag automatically, which shall be cleared by user's software.

**External Interrupt INT0 ~ 2:** When any external interrupt pin meets the interrupt conditions, external interrupt generates. The external interrupt INT0 and INT1 would set up interrupt flag IE0 and IE1 respectively, which will be automatically cleared by hardware rather than user. There are 4 external interrupt sources for INT0, 8 external interrupt sources for INT1 and 4 external interrupt sources for INT2, which can be set in rising edge, falling edge or dual edge interrupt trigger mode by setting SFRs (INTxF and INTxR). User can set the priority level of each interrupt through IP register. Besides, external interrupt INT0 ~ 2 can also wake up STOP mode of microcontroller unit.

## 9.2 Interrupt Structure Diagram

The SC92F854X interrupt structure is shown in the figure below:

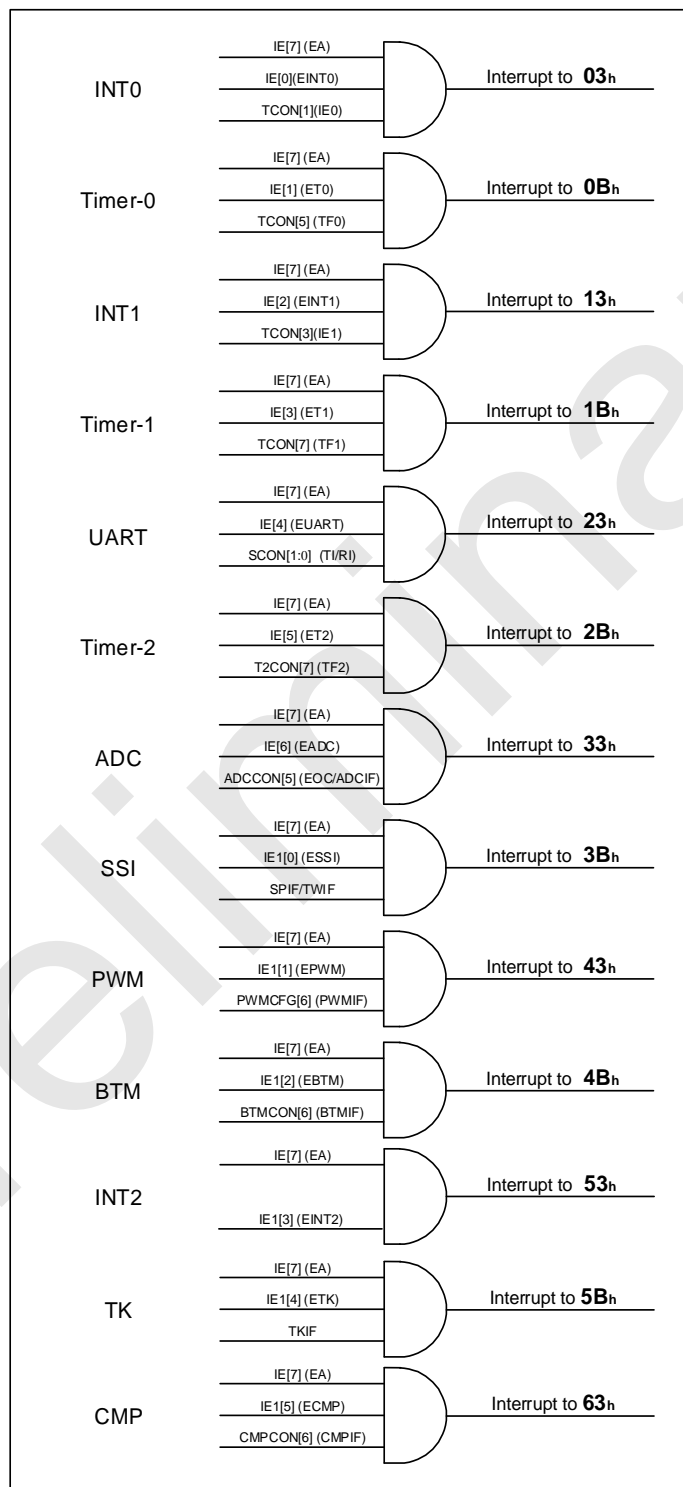

The SC92F854X Interrupt Structure and Vector

## 9.3 Interrupt Priority

The SC92F854X microcontroller unit has two-level interrupt priority capability. The interrupt requests of these interrupt sources can be programmed as high-priority interrupt or low-priority interrupt, which is to realize the nesting of two levels of interrupt service programs. One interrupt can be interrupted by a higher priority interrupt request when being responded to, which can not be interrupted by another interrupt request at the same priority level, until such response to the first-come interrupt ends up with the instruction "RETI". Exist the interrupt service routine and return to main program, the system would execute one more instruction before responding to new interrupt request.

That is to say:

① A lower priority interrupt can be interrupted by a higher priority interrupt request, but not vice verse;

② Any kind of interrupt being responded to can not be interrupted by another interrupt request at the same priority level.

Interrupt query sequence: As for the sequence of that the SC92F854X microcontroller unit responds to the same priority interrupts which occur in the meantime, the priority sequence of interrupt response shall be the same as the interrupt query number in C51, which is to preferentially respond to the interrupt with smaller query number then the interrupt with bigger query number.

## 9.4 Interrupt Processing Flow

When any interrupt generates and is responded by CPU, the operation of main program will be interrupted to carry out the following operations:

① Complete execution of instruction being currently executed;

② Push the PC value into stack for site protection;

③ Load Interrupt vector address into program counter (PC);

④ Carry out corresponding interrupt service program;

⑤ End Interrupt service program ends and execute RETI;

⑥ Pop PC value from stack and return to the program before responding to the interrupt.

During this process, the system will not immediately respond to other interrupts at the same priority level, but it will keep all interrupt requests having occurred and respond to new interrupt requests upon completing handling of the current interrupt.

# 10 Timer/Counter T0 and T1

The SC92F854X has two 16-bit Timer/Counters, Timer0 (T0) and Time1 (T1), with two operating modes: counter mode and timer mode. The operating modes selected by bit C/Tx in the SFR TMOD. T0 and T1 are essentially adding counters with different counting source. The source of timer generated from system clock or frequency division clock, but the source of counters is the input pulse to external pin. Only when TRx = 1, will T0 and T1 be enabled on for counting.

In counter mode, each input pulse on P0.2/T0 and P0.3/T1 pin will make the count value of T0 and T1 increase by 1 respectively.

In timer mode, users can select $f_{SYS}/12$ or $f_{SYS}$ ($f_{SYS}$ is the system clock after frequency division) as counting source of T0 and T1 by configuring SFR TMCON.

Timer/Counter T0 has 4 operating modes, and Timer/Counter T1 has 3 operating modes (Mode 3 does not exist):

① Mode 0: 13-bit Timer/Counter mode

② Mode 1: 16-bit Timer/Counter mode

③ Mode 2: 8-bit automatic reload mode

④ Mode 3: Two 8-bit timers/counters mode

In above modes, modes 0, 1 and 2 of T0 and T1 are the same, and mode 3 is different.

# 10.2 T0 Operating Modes

Timer0 can be configured in one of four operating modes by setting the bit pairs (M10, M00) in the TMOD register.

**Operating Mode 0: 13-bit Timer/Counter**

TH0 register is to store the high 8 bits (TH0.7 ~ TH0.0) of 13-bit Timer/Counter and TL0 is to store the low 5 bits (TL0.4 ~ TL0.0). The high three bits of TL0 (TL0.7 ~ TL0.5) are filled with uncertain values, they shall be omitted upon reading. When 13-bit Timer/Counter overflows with count increment, the system will set timer overflow flag TF0 to 1. An interrupt will be generated if the timer0 interrupt is enabled.

C/T0 bit selects the clock input source of Timer/Counter. If C/T0=1, the level fluctuation from high to low of Counter 0 input pin T0 (P0.2) will make Counter 0 data register add 1. If C/T0=0, the frequency division of system clock is the clock source of Timer0.

When TR0 = 1, Timer 0 is enabled. Setting TR0 would not reset the timer forcibly. It means that the timer register will start to count from the value of last clearing of TR0. Therefore, before enable the timer, it is required to configure the initial value of timer register.
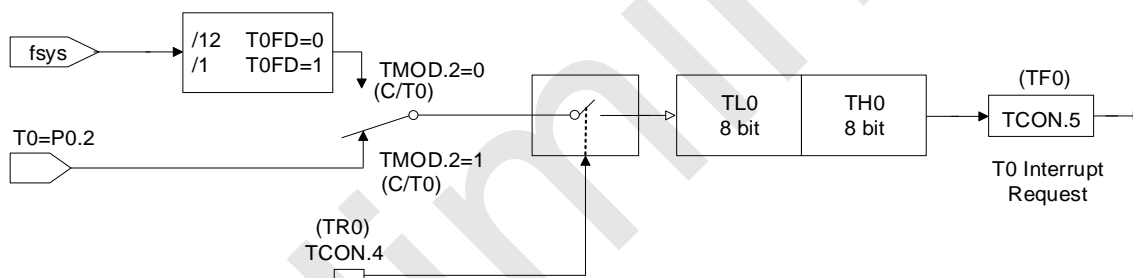

When configured as a timer, the SFR T0FD is used to select fractional frequency ratio of clock source.

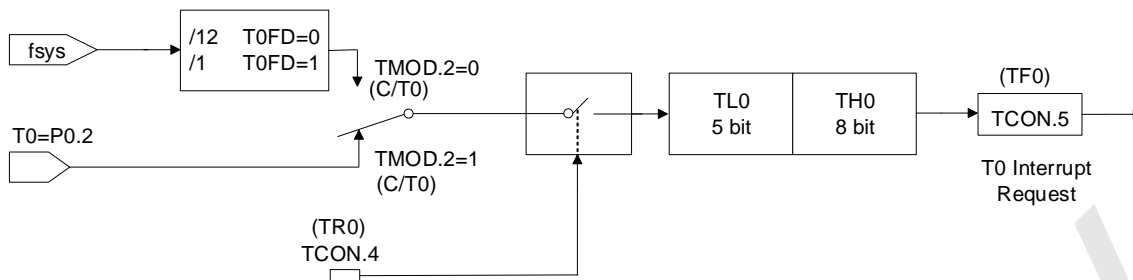

Operating mode 0: 13-bit Timer/Counter

## Operating Mode 1: 16 Counter/Timer

Except for using 16 bits of (valid for all 8 bits of TL0) Timer/Counter, in mode 1 and mode 0, the operating mode, opening and configuration method are the same.

Operating mode 0: 16-bit Timer/Counter

## Operating Mode 2: 8 Automatic Reload Counter/Timer

In operating mode 2, Timer0 is 8-bit automatic reload Timer/Counter. TL0 is to store counting value and TH0 is to store the reload value. When the counter in TL0 overflows and turn to 0x00, the overflow flag of Timer TF0 will be set to 1, and the data in register TH0 will be reloaded into register TL0. If the timer interrupt enabled, setting TF0 to 1 will generate an interrupt, but the reloaded value in TH0 will remain the same. Before starting the Timer to count correctly, TL0 shall be initialized to the required value.

Except for automatic reloaded function, the enabling and configuration mode of Timer/Counter in operating mode 2 shall be the same as that in mode 0 and mode 1.

When configured as a timer, the SFR TMCON bit 0 (T0FD) is used to select fractional frequency ratio of system clock $f_{SYS}$.

Operating Mode 2: 8 Automatic Reload Counter/Timer

### Operating Mode 3: Two 8-bit Counter/Timer (only for Timer0)

In operating mode 3, Timer0 is used as two independent 8-bit Timer/Counters, respectively controlled by TL0 and TH0. TL0 is controlled by control bit (in TCON) and status bit (in TMOD) of Timer0 (TR0), C/T0, TF0. Timer0 is selected as Timer or Counter by TMOD bit 2 (C/T0).

TH0 is only limited to in Timer Mode, which is unable to configure as a Counter by TMOD.2 (C/T0). TH0 is enabled by set the timer control bit TR1 to 1. When overflow occurs and interrupt is discovered, set TF1 to 1 and proceed the interrupt as T1 interrupt.

When T0 is configured in Operating Mode 3, TH0 Timer occupies T1 interrupt resources and TCON register and the 16-bit counter of T1 will stop counting, equivalently "TR1=0". When adopting TH0 timer, it is required to configure TR1=1.

## 10.3 T1 Operating Modes

Timer1 can be configured in one of three operating modes by setting the bit pairs (M11, M01) in the TMOD register.

### Operating Mode 0: 13-bit Timer/Counter

TH1 register is to store high 8-bit (TH1.7 ~ TH1.0) of 13-bit Timer/Counter and TL1 is to store low 5-bit (TL1.4 ~ TL1.0). The high 3-bit of TL1 (TL1.7 ~ TL1.5) are uncertain values, they shall be omitted upon reading. When 13-bit Timer/Counter overflow with count increment, the system will set timer overflow flag TF1 as1. An interrupt will be generated if the timer1 interrupt is enabled. C/T1 bit selects the clock input source of Timer/Counter.

If C/T1=1, the level fluctuation from high to low of timer1 input pin T1 (P0.3) will make timer1 data register add 1. If C/T1=0, the frequency division of system clock is the clock source of timer1.

When TR1 is set to 1 and the timer is enabled. Setting TR1 does not force to reset timer counters, it means, if set TR1 to 1, the timer register will start to count from the value of last clearing of TR1. Therefore, before allowing timer, it is required to configure the initial value of timer register.

When configured as timer, the SFR T1FD is used to select fractional frequency ratio of clock source.
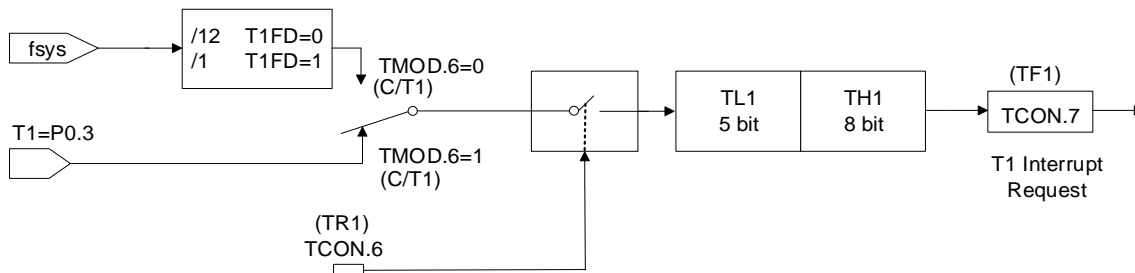

Operating mode 0: 13-bit Timer/Counter

## Operating Mode 1: 16 Counter/Timer

Except for using 16-bit (valid for 8-bit data of TL1) Timer/Counter, the operating mode of mode 1 and mode 0 is the same. And the opening and configuration mode of both are also the same.

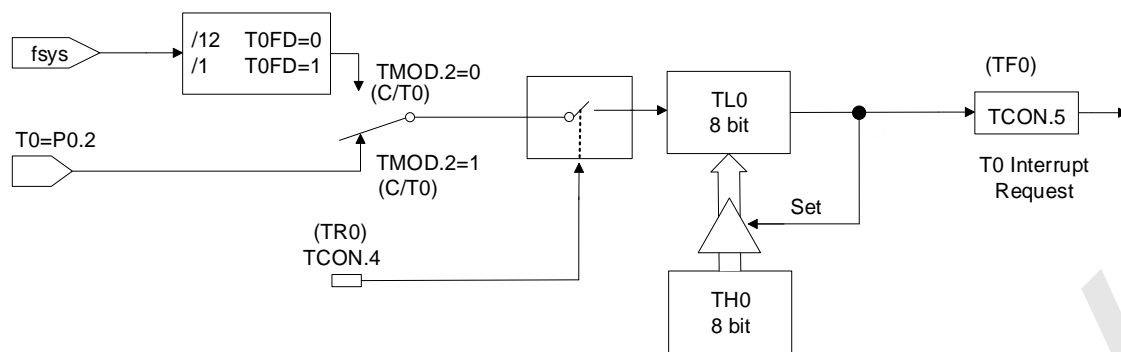

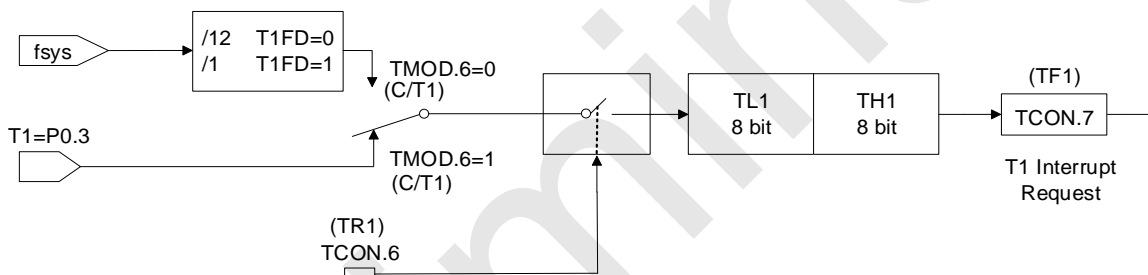

Operating mode 0: 16-bit Timer/Counter

## Operating Mode 2: 8 Automatic Reload Counter/Timer

In operating mode 2, Timer1 is 8-bit automatic reload Timer/Counter. TL1 is to store counting value and TH1 is to store the reload value. When the counter in TL1 overflows 0x00, the overflow flag of Timer TF1 will be set to 1, and the value of register TH1 will be reloaded into register TL1. If enable the timer interrupt, setting TF1 to 1 will generate an interrupt, but the reloaded value in TH1 will remain unchanged. Before allowing Timer to correctly count, TL1 shall be initialized to the required value.

Except for automatic reloaded function, the enabling and configuration mode of Timer/Counter in operating mode 2 shall be the same as that of mode 0 and mode 1.

When configured as timer, the SFR TMCON bit 4 (T1FD) is used to select the ratio of clock source of timer to fractional frequency of system clock $f_{SYS}$.
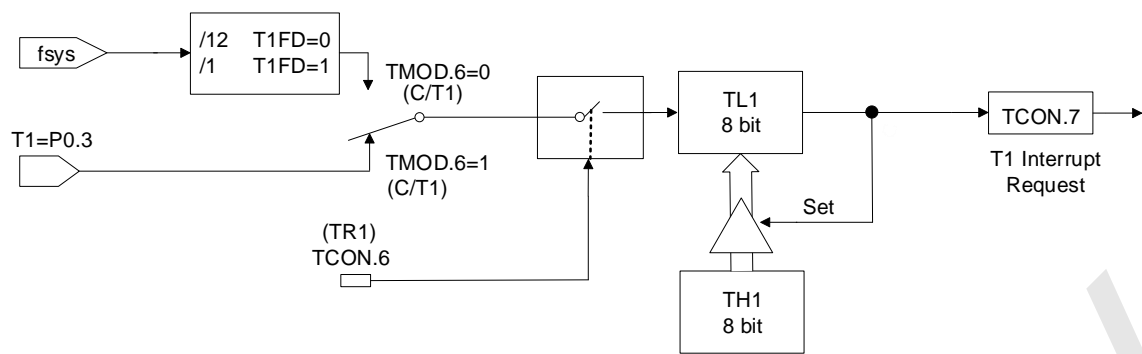

Operating Mode 2: 8 Automatic Reload Counter/Timer

# 11 Timer/Counter T2

Timer2 inside the SC92F854X microcontroller unit has two operating modes, namely counter mode and timer mode. There is a control bit C/T2 in SFR T2CON to select Timer or Counter for T2. They are adding counters in nature, differing in counting source. The clock source of T2 comes from system clock or frequency division clock, but the source of counters is the input pulse to external pin. TR2 is the counting switch of Timer/Counter T2. Only when TR2 = 1, will T2 be enabled for counting.

In counter mode, each input pulse on T2 pin will make the counting value of T2 increase by 1.

In timer mode, users can select $f_{SYS}/12$ or $f_{SYS}$ as counting source of T2 by configuring SFR TMCON.

Timer/Counter T2 has 4 operating modes:

① Mode 0: 16-bit capture mode

② Mode 1: 16-bit automatic reload timer mode

③ Mode 2: Baud rate generator mode

④ Mode 3: Programmable clock output mode

## 11.2 T2 Operating Modes

The operating mode and configuration mode of Timer2 are shown in the table below:

| C/$\overline{T2}$ | T2OE | DCEN | TR2 | $\overline{CP}$/ RL2 | RCLK | TCLK | | Mode |
|---|---|---|---|---|---|---|---|---|
| X | 0 | X | 1 | 1 | 0 | 0 | 0 | 16-bit capture |
| | | | | | | | | 16-bit capture 16-bit capture |
| X | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 16-bit automatic reload timer |
| X | 0 | 1 | 1 | 0 | 0 | 0 | | |
| X | 0 | X | 1 | X | 1 | X | 2 | Baud Rate Generator |
| | | | | | X | 1 | | |
| 0 | 1 | X | 1 | X | 0 | 0 | 3 | Only used for programmable clock |
| | | | | | 1 | X | 3 | Programmable clock output with baud rate generator |
| | | | | | X | 1 | | |
| X | X | X | 0 | X | X | X | X | Timer2 stops, but T2EX channel is also available |
| 1 | 1 | X | 1 | X | X | X | | Not recommended |

**Operating Mode 0: 16-bit capture**

In capture mode, there are two options for EXEN2 bit in T2CON.

If EXEN2 = 0, Timer2 is taken as 16-bit timer or counter; if ET2 is set to 1, Timer2 will set up TF2 and generate an interrupt when Timer2 overflows.

If EXEN2=1, conduct the same operations as above on Timer2, the falling edge signal on external input T2EX can make current value in TH2 and TL2 captured into RCAP2H and RCAP2L. Besides, the falling edge signal on T2EX can also cause EXF2 in T2CON to be set to 1. If ET2 is set to 1, bit EXTF2, like TF2, will also trigger an interrupt.
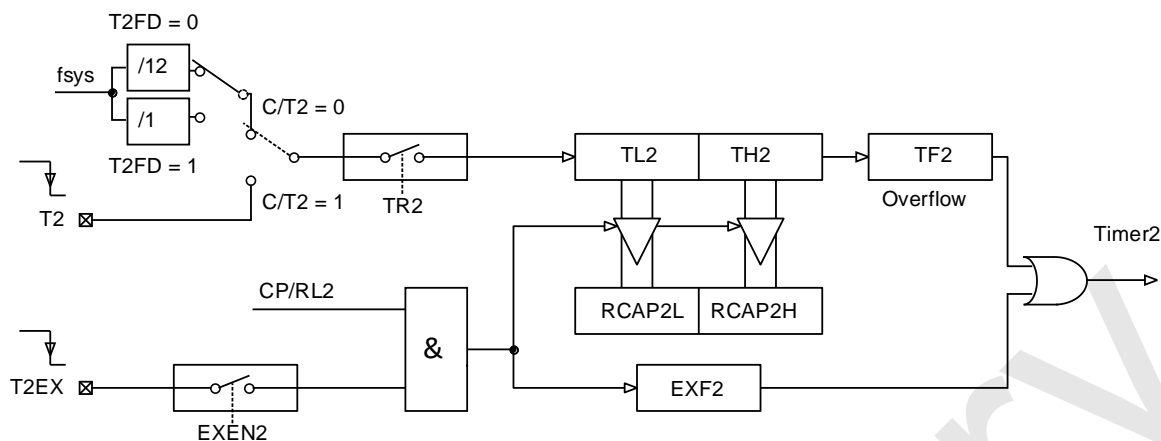

Operating Mode 0: 16-bit capture

## Operating Mode 1: 16-bit Automatic Reload Timer

In the 16-bit automatic reload mode, Timer2 can be selected to work in incrementing or decreasing counting mode. This function can be selected by DCEN bit in T2MOD (decreasing counting allowed). After system reset, the reset value of DCEN bit is 0 and Timer2 is defaulted as decreasing counting. When setting DCEN to 1, the incrementing or decreasing counting depends on the level of T2EX pin.

When DCEN = 0, There are two options for EXEN2 bit in T2CON:

1.  EXEN=0, Timer2 will increase to 0xFFFFH and set TF2 bit after overflow. Meanwhile, the timer will load 16-bit value in registers RCAP2H and RCAP2L written by user software into registers TH2 and TL2 automatically.

2.  EXEN2=1, both the overflow and the falling edge signal on external input T2EX can trigger a 16-bit count value reloading and set EXF2 bit. If T2 interrupt is enabled (ET2=1), both TF2 and EXF2 bit can generate an interrupt.

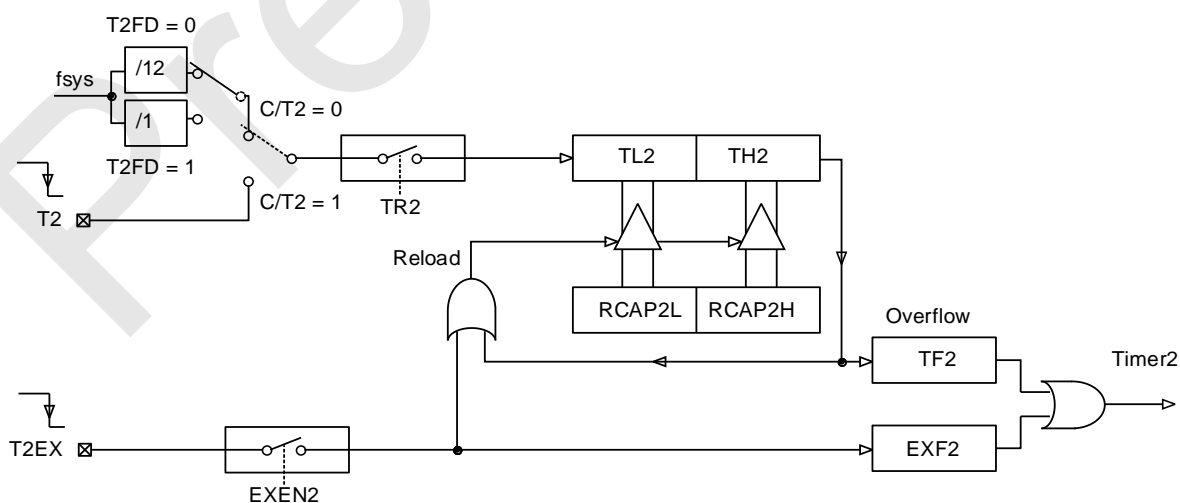

Operating Mode 1: 16-bit Automatic Reload Timer DCEN = 0

Configure CEN bit to allow Timer2 for incremental or decreasing counting. When DCEN=1, T2EX pin controls the count direction, and the control of EXEN2 becomes invalid.

Setting T2EX to 1 can conduct incremental count on Timer2. The Timer overflows when it increases to 0xFFFFH, then it sets TF2 bit. Besides, the overflow can also respectively cause 16-bit value in RCAP2H and RCAP2L to be reloaded into timer registers.

Setting T2EX to 0 can conduct decreasing count on Timer2. When the value in TH2 and TL2 is equal to that of RCAP2H and RCAP2L, the timer overflows. TF2 bit will be set up and 0xFFFFH reloaded into timer register.

No matter whether timer2 overflows or not, bit EXF2 will be used as the 17$^{th}$ bit of the results. Under such operating mode, EXF2 is no longer taken as interrupt flag.

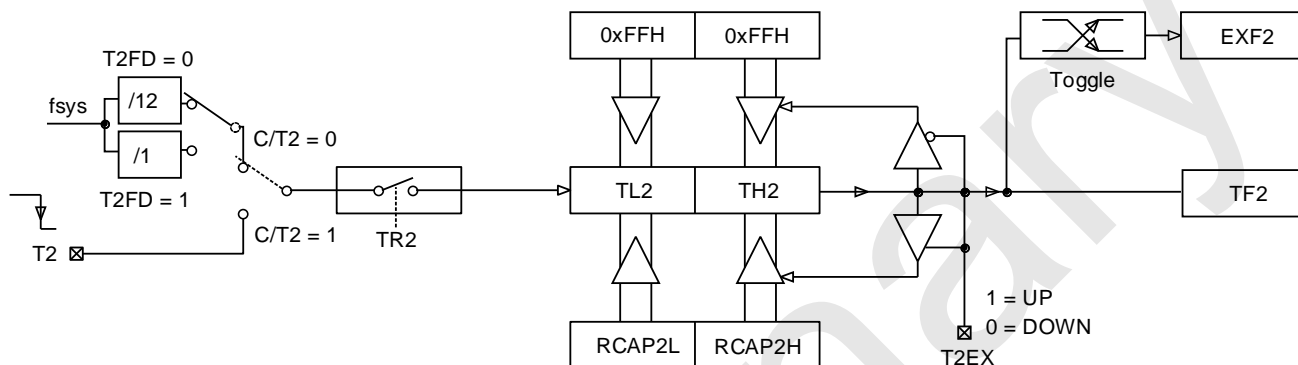

Operating Mode 1: 16-bit Automatic Reload Timer DCEN = 1

**Operating Mode 2: Baud Rate Generator**

Configure TCLK and RCLK in T2CON register to select Timer2 as baud rate generator. The baud rate of receiver and transmitter can be different. If Timer2 is taken as either one between receiver and transmitter, Timer1 will be taken as another Baud-rate register.

Configure TCLK and RCLK in T2CON register to make Timer2 in baud rate generator mode. Such mode is similar to automatic reload mode

Overflow of Timer2 can make the value in registers RCAP2H and RCAP2L reloaded into the Timer2 and counting, but no interrupt will occur.

If EXEN2 is set to 1, the falling edge on T2EX pin will be set up EXF2 without a reloading. Therefore, when Timer2 is taken as baud rate generator, T2EX can be taken as an additional external interrupt

The baud rate of UART0 mode 1 and mode 3 depends on overflow rate of Timer2 and the following formula:

$$\text{BaudRate} = \frac{\text{fsys}}{[\text{RCAP2H,RCAP2L}]};\text{ (note: [RCAP2H, RCAP2L] must be larger than 0x0010)}$$

The schematic diagram of Timer2 as baud rate generator is shown as follows:
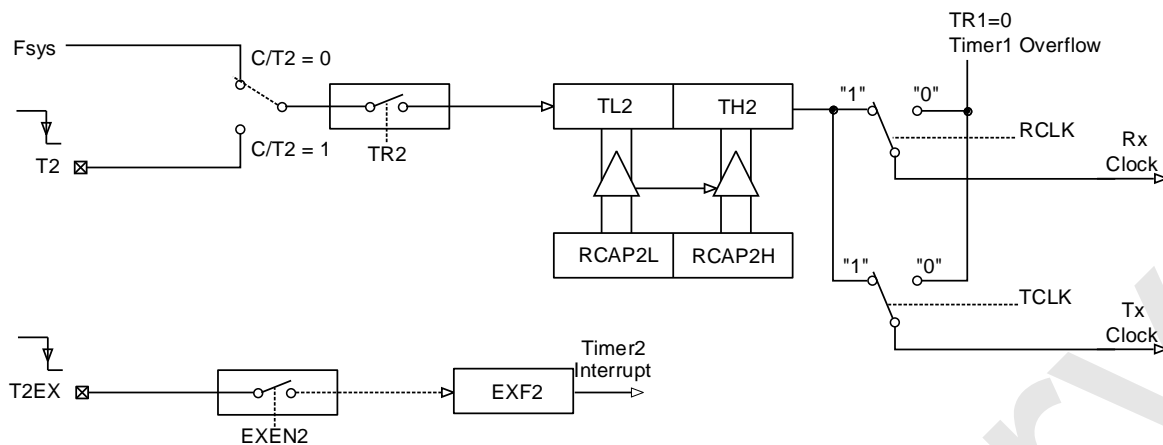

Mode 2: Baud Rate Generator

## Operating Mode 3: Programmable Clock Output

In this mode, T2(P0.5) can be programmed to output a 50% duty cycle clock: when $C/\overline{T2} = 0$ and T2OE = 1, Timer2 is taken as clock generator

In this mode, duty cycle of T2 output clock is 50%

$$\text{Colck Out Frequency} = \frac{\text{fn2}}{(65536 - [\text{RCAP2H},\text{RCAP2L}]) \times 4} ;$$

Including, fn2 is the clock frequency of Timer2

$$\text{fn2} = \frac{\text{fsys}}{12}; \quad \text{T2FD} = 0$$

$$\text{fn2} = \text{fsys}; \quad \text{T2FD} = 1$$

Overflow of Timer2 does not generate an interrupt, T2 pin is clock output.
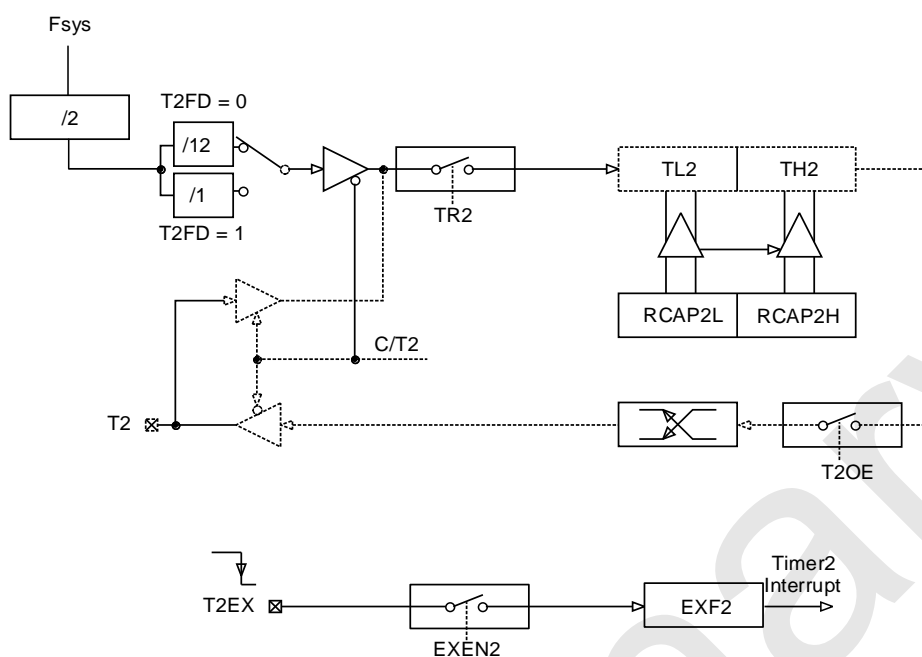

Operating Mode 3: Programmable Clock Output

**Note:**

**1. Both TF2 and EXF2 can generate interrupt request of Timer2, both of which has the same interrupt vector;**

**2. TF2 and EXF2 can be set by software, only software and hardware reset can clear TF2 and EXF2;**

**3. When EA = 1 and ET2 = 1, setting up TF2 or EXF2 to 1 can arouse interrupt of Timer2;**

**4. When Timer2 is taken as baud rate generator, the value written in TH2/TL2 or RCAP2H/RCAP2L may influence the accuracy of baud rate and thus result in error of communication.**

# 12 Multiplier-Divider Unit (MDU)

The SC92F854X provides a 16-bit multiplier-divider, which is composed of extended accumulator EXA0 ~ EXA3, extended B register EXB and operation control register OPERCON. It can replace the software 16-bit*16-bit multiply operation and 32-bit /16-bit division operation.

| Mnemonic | Add | Description | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | POR |
|---|---|---|---|---|---|---|---|---|---|---|---|
| EXA0 | E9H | Extended Accumulator 0 | | | | EXA [7: 0] | | | | | 00000000b |
| EXA1 | EAH | Extended Accumulator 1 | | | | EXA [15: 8] | | | | | 00000000b |
| EXA2 | EBH | Extended Accumulator 2 | | | | EXA [23: 16] | | | | | 00000000b |
| EXA3 | ECH | Extended Accumulator 3 | | | | EXA [31: 24] | | | | | 00000000b |
| EXBL | EDH | Extended B Register L | | | | EXB [7: 0] | | | | | 00000000b |
| EXBH | EEH | Extended B Register H | | | | EXB [15: 8] | | | | | 00000000b |

| remainder 16bits | - | - | EXBH | EXBL |

**Note:**

1. **During the operation process, it is forbidden to read or write EXA and EXB data registers.**

2. **The time for operation conversion of multiplier is 16/f$_{SYS}$.**

# 13 PWM

The SC92F854X provides an independent counter, which is able to support 8-channel PWM output: PWM0 ~ 7. The SC92F854X PWM has the following functions:

① 12-bit PWM precision;

② 8-channels have the same period, but the duty ratio can be set separately;

③ Output can be configured in forward or reverse direction.

The cycle and duty cycle of the SC92F854X PWM is adjustable. Registers PWMCFG, PWMCON controll PWM status and cycle as well as opening of each channel of PWM and duty cycle of output waveform can be adjusted separately.

**Note:**

**1. PWM duty ratio adjusting registers can only be written but is unreadable;**

**2.The clock source of PWM is fixed as $f_{HRC}$ = 16MHz, which is independent of the conversion of system clock.**

**Note: if ENPWM set to 1, the PWM module is turned on, but when ENPxy=0, the PWM output is turned off and acts as GPIO. At this time, the PWM module can be used as a 12-bit Timer, and when EPWM(IE1.1) is set to 1, PWM still generates interrupts.**

## 13.3 PWM Waveforms and Directions

The influence of changing various SFR parameters on PWM waveform is shown as follows:

① Diagram for Duty Cycle Change features

When PWMn outputs waveform, if it is required to change the duty cycle, users can change the value of high level configuration registers (PDTxy). Note that changing the value of PWMDTYn will change the duty cycle immediately.

② Period Change features

Diagram for Period Change Features

When PWMn outputs waveform, if it is required to change the period, the user can change the value of period configuration registers PWMPRD. Same as changing the duty cycle, change the value of PWMPRD will change the period immediately..

③ Relationship between Period and Duty cycle

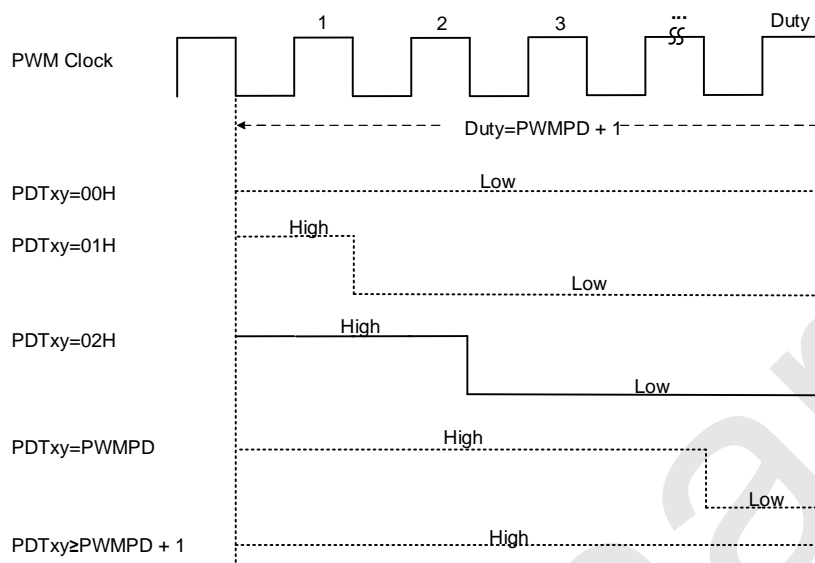

Diagram for Relationship between Period and Duty cycle

The relationship between period and duty cycle is shown in the figure above. The precondition of this result is the PWM output reverse control (INVxy) is initialized to 0; if it is required to get the contrary result, set INVxy to 1.

# 14 General-purpose I/O (GPIO)

The SC92F854X offers up to 46 bidirectional controllable GPIOs, input and output control registers are used to control the input and output state of various ports, when the port is used as input, each I/O port is equipped with internal pull-up resistor controlled by PxPHy. Such 46 IOs are shared with other functions, including P3 can be used as LCD COM driver by configuring output voltage as 1/4 $V_{DD}$ or 1/3$V_{DD}$. Under output state, I/O port reads the value in the port data register.

**Note: Unused IO port or IO port with no package pin shall be configured as strong push-pull output mode.**

## 14.1 GPIO Structure Diagram

**Strong Push-pull Output Mode**

In strong push-pull output mode, it is able to provide continuous high current drive: high output for the current larger than 17mA and low output for the current larger than50mA

The port structure diagram for strong push-pull output mode is shown below:

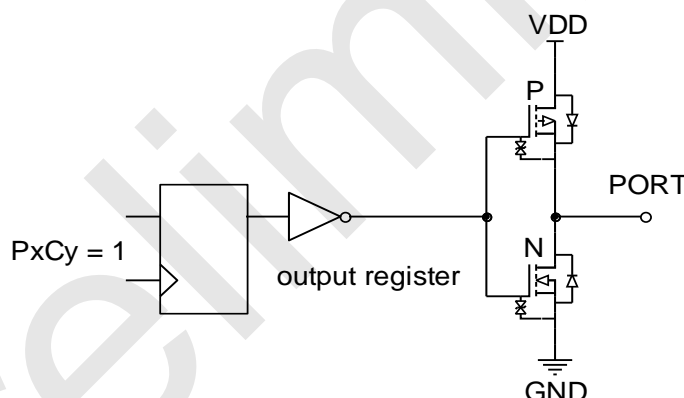

Strong Push-pull Output Mode

**Pull-up Input Mode**

In pull-up input mode, a pull-up resistor is connected on the input port, only when the level on the input port is pulled down, low level signal can be detected.

Pull-up Input Mode

PxCy = 0
PxHy = 1
**High Impedance Input Mode. (Input only)**

The port structure diagram for input only mode is shown below:

PxCy = 0
PxHy = 0

High- impedance Input Mode

# 15 LCD/LED Display Driver

SC92F8547/ 8546/ 8543 integrates LCD/LED hardware display driver circuit, facilitating user to realize LCD and LED display driver. The major features of LCD/LED driver are shown below:

1. Supports LCD/LED display driver functions, and users can only select one at the same time;

2. LCD and LED display driver share the same IO pins and registers.

**LCD display driver functions are shown below:**

1. 4 display driver modes: 8 X 24, 6 X 26, 5 X 27 or 4X 28;

2. 2 bias modes: 1/4 Bias or 1/3 Bias;

3. 4 level com port drive capabilities;

4. Display driver circuit can select either built-in 128K LRC or external 32K oscillator as clock source with frame frequency of about 64 Hz.

**LED display driver functions are shown below:**

1. 4 display driver modes: 8 X 24, 6X 26, 5 X 27 or 4X 28;

2. 4 level segment port drive capabilities;

3. Display driver circuit can select either built-in 128K LRC or external 32K oscillator as clock source with frame frequency of about 64 Hz.

OTCON = 0x00;

LCDRAM[led_addr] = led_data;   // Write the value to be displayed to LED RAM.

**SinOne**

# 16 Serial Interface 0 (UART0)

The SC92F854X supports a full-duplex serial port. It is convenient for connecting other device or equipment, for example, WiFi module or other drive chips with UART communication interface. UART0 functions and features are shown below:

1. Three kinds of communication mode: Mode 0, Mode 1 and Mode 3;

2. Configure Timer1 or Timer2 as baud rate generator;

3. Completion of transmission and reception can generate interrupt RI/TI, and such interrupt flag needs to be cleared up by software.

**SCON (98H) Serial Port Control Register (Read/Write)**

| 7 | **SMOD** | Baud rate multiplying power configuration bit, only valid for mode 0 (SM0 ~ 1 = 00):<br><br>0: Serial port operates under clock of 1/12 system clock<br><br>1: Serial port operates under clock of 1/4 system clock |

# 16.1 Baud Rate of Serial Communication

In mode 0, baud rate can be programmed as 1/12 or 1/4 of system clock and determined by SMOD (PCON.7) bit. When SMOD is set to 0, the serial port operates in 1/12 of system clock. When SMOD is set to 1, serial port operates in 1/4 of system clock.

In mode 1 and mode 3, the user can select overflow rate of Timer1 or Timer2 as baud rate by configuration.

Set TCLK (T2CON.4) and RCLK (T2CON.5) bit to configure Timer2 as TX and RX clock source of baud rate (Refer to the timer section for details). No matter TCLK or RCLK is set to logic 1, Timer2 can be in the mode of baud rate generator. If TCLK and RCLK are set to logic 0, Timer1 can be baud clock source of Tx and Rx.

Mode 1 and Mode 3 baud rate formula is shown below, including that [TH1、TL1] are the 16-bit counter registers of Timer1, and [RCAP2H、RCAP2L] are the 16-bit reload registers of Timer2.

1. When Timer1 is used as baud rate generator, it must stop counting, meaning TR1=0:

$$BaudRate = \frac{fsys}{[TH1,TL1]}$$ (**Note: [TH1, TL1] must be larger than 0x0010**)

2. When Timer2 is used as baud rate generator:

$$BaudRate = \frac{fsys}{[RCAP2H,RCAP2L]}$$ (**Note: [RCAP2H, RCAP2L] must be larger than 0x0010**)

# 17 SPI/TWI/UART Serial Interface (SSI)

The SC92F854X integrates SPI/TWI/UART serial interface circuits (SSI), which is convenient for connecting MCU to devices or equipment with different interfaces. The user can configure SSI in any communication mode among SPI, TWI and UART by configuring SSMOD[1: 0] bit of register OTCON. Its features are shown below:

1. SPI mode can be configured as master mode or slave mode

2. TWI mode can only be used as slave in communication

3. UART mode can work in Mode 1 (10-bit full-duplex asynchronous communication) and Mode 3 (11-bit full-duplex asynchronous communication)

Specific configuration modes are shown below:

**OTCON (8FH)** Output Control Register (Read/Write)

## 17.1 Serial Peripheral Interface (SPI)

SSMOD[1: 0] = 01, SSI is configured as SPI interface. Serial Peripheral Interface (SPI) is a kind of high-speed serial communication interface, allowing MCU and peripheral equipment (including other MCUs) to conduct full-duplex synchronous serial communication.

## 17.1.2 Signal Description

**Master-Out/Slave-In (MOSI)**

This signal connects master device with one slave device. Data is serially transmitted from master device to slave device via MOSI, featuring master device output and slave device input.

**Master-In and Slave-Out (MISO):**

This signal connects slave device with master device. Data is serially transmitted from slave device to master device via MISO, featuring slave device output and master device input. When SPI is configured as slave device and is not selected, the MISO pin of slave device is in high-impedance state.

**SPI Serial Clock (SCK)**

SCK signal is used to control synchronous movement of input and output data on MOSI and MISO. Transmit one byte for every 8 clock periods. If no slave device is selected, SCK signal will be ignored from slave device.

## 17.1.3 Operating Modes

SPI can be configured as master mode or slave mode. The configuration and initialization of SPI module can be completed via setting SSCON0 register (SPI Control Register) and SSCON1 (SPI State Register). After completing configuration, data is transmitted by setting SSCON0, SSCON1 and SSDAT (SPI Data Register).

During SPI communication period, data is synchronically and serially moved in or out. Serial clock line (SCK) makes data movement and sampling on two serial data lines (MOSI and MISO) keep synchronous. If any slave device is not selected, it is unable to participate in activities on SPI line.

When SPI master device transmits data to slave device via MOSI, slave device sends data to master device via MISO as response, which realizes synchronous full-duplex transmission of data transmitting and receiving at the same clock. The transmit shift register and the receive shift register use the same special function address. Conducting write operations to SPI data register(SSDAT) will write data to the transmit shift register, and conducting read operations to SSDAT will obtain the data from the receive shift register.

The SPI interface of some devices will lead to SS pin (Slave Select, active-low). When communicating with the SC92F854X SPI, the SS pin from other devices on SPI bus shall be connected based on different communication modes. The following table lists the connection modes of the SS pin from other devices on SPI bus under different communication modes of the SC92F854X SPI:

| SC92F854X SPI | Other Devices on SPI Bus | Mode | SS of Slave Device (Slave Device Select Pins ) |
|---|---|---|---|
| Master Mode | Slave Mode | One Master One Slave | Pull low |
| | | One Master Multiple Slaves | The SC92F854X leads to multiple I/Os, which respectively connect to the SS pin of slave device. Before data transmission, the SS pin of slave |

| | | | device must be pulled low |
|---|---|---|---|
| Slave Mode | Master Mode | One Master One Slave | Pull high |

**Master Mode**

● **Mode Startup:**

Start of all data transmission on SPI bus is controlled by SPI master device. When MSTR bit in SSCON0 register is set to 1, SPI operates in master mode, and only one master device can start the transmission.

● **Transmitting:**

In SPI master mode, write one byte of data to SPI data register SSDAT, the data will write to the transmit shift buffer. If any data already exists in the transmit shift register, one WCOL signal will be generated from master SPI to indicate writing is too fast. However, data in the transmit shift register will not be influenced and transmitting will not be interrupted as well. Besides, if the transmit shift register is empty, the master device will move the data in the transmit shift register to MOSI line serially according to SPI clock frequency on SCK. After transmission, SPIF bit in SSCON1 register will be set to 1. If SPI interrupt is allowed, when SPIF bit is set to 1, an interrupt will be generated as well.

● **Receiving:**

When master device transmits data to slave device via MOSI line, corresponding slave device will also transmit the contents in the transmit shift register to the receive shift register of master device via MISO line so as to realize full-duplex operations. Therefore, setting SPIF flag bit to 1 indicates that transmission is completed and data has been received. Data received from slave device is stored in the receive shift register of master device in accordance with MSB first or LSB first transmission direction. When one byte of data is completely moved to the receive register, the processor can obtain such data by reading SSDAT register.

**Slave Mode**

● **Mode Startup:**

When the MSTR bit in SSCON0 register is clear to 0, SPI operates in slave mode.

● **Transmitting and Receiving:**

In slave mode, according to SCK signal controlled by master device, data is moved in via MOSI pin and out via MISO pin. A 1-bit counter records the number of SCK edge. When the receive shift register moves in 8-bit data (one byte) and the transmit shift register moves out 8-bit data (one byte), SPIF flag is set to 1. Data can be obtained by reading SSDAT register. If SPI interrupt is allowed, when setting SPIF to 1, an interrupt will be generated as well. At this time, the receive shift register keeps original data and set SPIF bit to 1, thus SPI slave device will not receive any data until SPIF is cleared to 0. SPI slave device must write the data to be transmitted before master device starts a new data transmission to the transmit shift register. If no data is written before transmitting, slave device will transmit "0x00" bytes to master device. If SSDAT writing operation occurs during the process of transmission, the WCOL flag bit of SPI slave device is set to 1. That is to say, if data is already included in the transmit shift register, WCOL bit of SPI slave device is set to 1, indicating conflict of SSDAT writing. But the data of shift register will not be influenced and transmission will not be interrupted.

## 17.1.4 Transfer Form

By setting CPOL bit and CPHA bit of SSCON0 register by software, the user can select four combinations of SPI clock polarity and clock phase. CPOL bit defines the polarity of clock, meaning the level status when idle, which has little influence on SPI transmission format. CPHA bit defines the phase of clock, meaning clock edge allowing data sampling shift. In two devices of master and slave communication, the configuration of clock polarity and phase shall be consistent.

When CPHA = 0, first edge of SCK captures data, and slave device must get the data ready before the first edge of SCK.

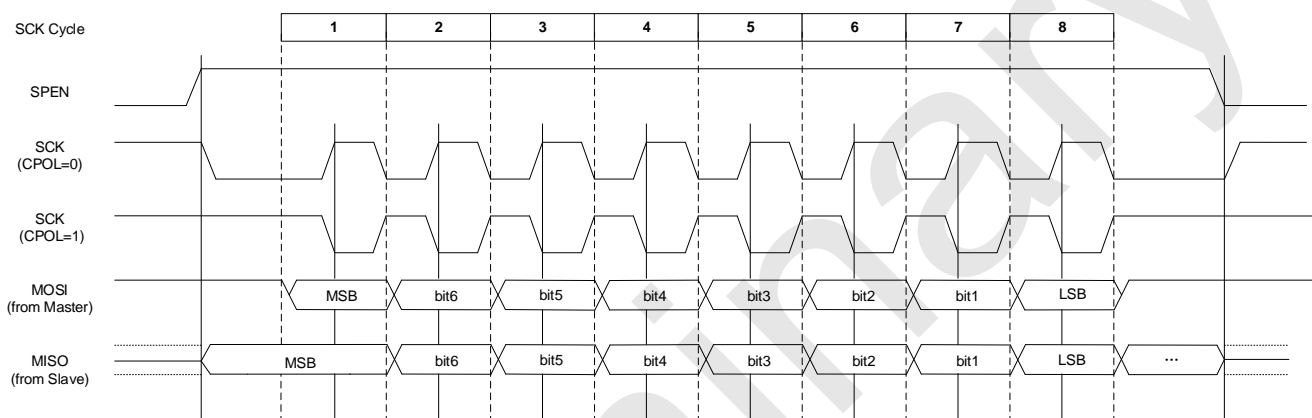

CPHA = 0 Data Transmission

When CPHA = 1, master device outputs data to MOSI line at the first edge of SCK, slave device takes the first edge of SCK as the signal of start transmitting and start capturing data at the second edge of SCK. Therefore, user must complete SSDAT writing operation in two edges of first SCK. Such data transmission form is the preferred form of communication between one master device and one slave device.

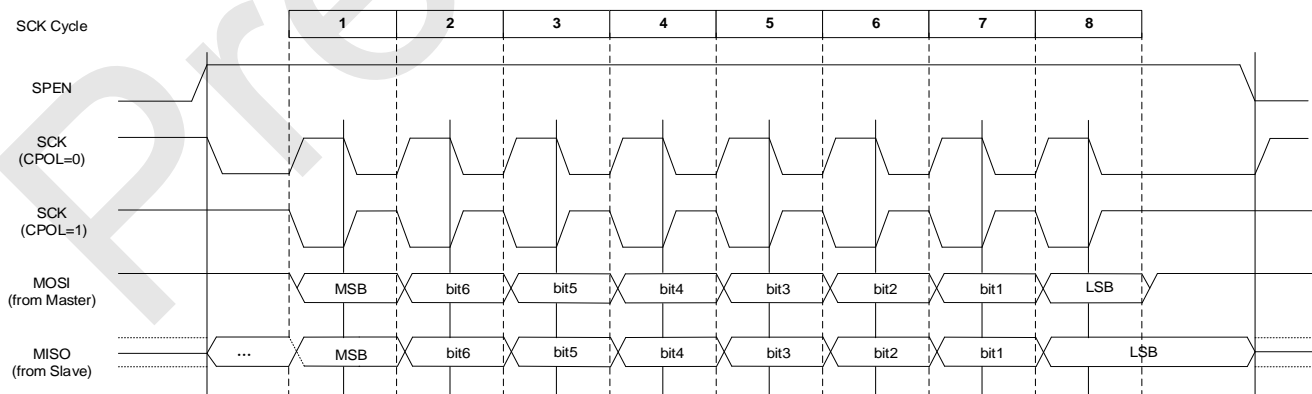

CPHA = 1 Data Transmission

## 17.1.5 Error Detection

Writing to SSDAT register may cause conflict during the period of transmitting data sequence, set WCOL bit in SSCON1 register to 1. Setting WCOL bit to 1 will not generate interrupt, and transmitting will not be interrupted.

WCOL bit shall be cleared by software.

## 17.2 TWI

## 17.2 Two-Wire Interface (TWI)

## 17.2.1 Signal Description

**TWI Clock Signal Line (SCL)**

This clock signal is sent from master device and connects all slave device. One byte of data is transmitted for every 9 clock periods. First 8 periods are used for data transmission and last one for receiver response clock.

**TWI Data Signal Line (SDA)**

SDA is a bidirectional signal line, and shall be in high level when idling, which is pulled up by pull-up resistance on SDA line.

## 17.2.2 Operating Modes

TWI communication of the SC92F854X has only slave device mode:

● **Mode Startup:**

When TWI enabling flag bit opens (TWEN = 1) and receives start-up signal sent from master device, this mode is initiated.

The slave device enters first frame address (STATE[2: 0] = 001) state from idle mode (STATE[2: 0] = 000), and waits for first frame data from master device. First frame data is sent by master device, including 7-bit address bit and 1-bit read and write bit, all slave devices on TWI bus will receive first frame data of master device. After transmitting first frame data, master device will release SDA signal line. If the address sent by master device is the same as the value of address register of slave device, it indicates that the slave device has been selected and the selected slave device will judge to connect the 8th bit on the bus, which is the data read and write bit (=1, reading the command; =0, writing the command), then occupies SDA signal line, after transmitting a low-level response signal at the 9th clock period of SCL, release the bus. After the slave device is selected, enter into different status according to different read and write bits.

● **Non-general address response, slave device receiving mode:**

If the read and write bit received from the first frame is writing (0), the slave device enters into the receiving state of slave device (STATE [2: 0] = 010), and wait for data sent from receiving master device. Master device will release the bus for transmitting every 8 bits and then wait for the response signal of 9$^{th}$ period of slave device.

1. If the response signal from slave device is in low level, there are three modes of master communication:

    1) Continue to send data;

    2) Resend start signal, then the slave device enters into the state of receiving first frame address (STATE[2: 0] = 001);

    3) Send stopping signal, indicating this transmission is ended, slave device returns to idle state and wait for next start signal from master device.

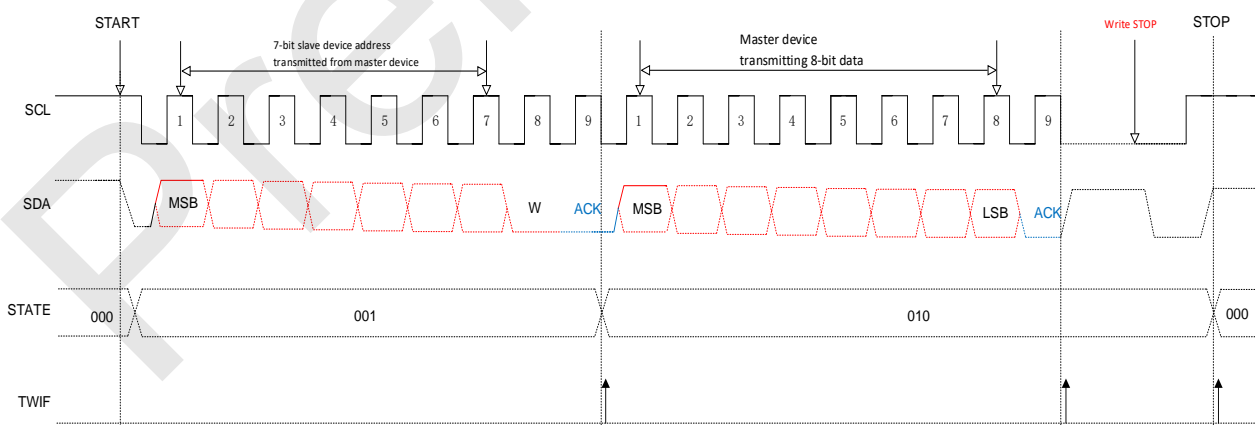

2. If the response state of slave device is in high level (during the receiving process, the value of AA in slave device register is rewritten to 0), it indicates that after transmitting current bytes, the slave device will stop this transmission automatically and return to idle state (STATE[2: 0] = 000), without receiving data sent from master device any more.
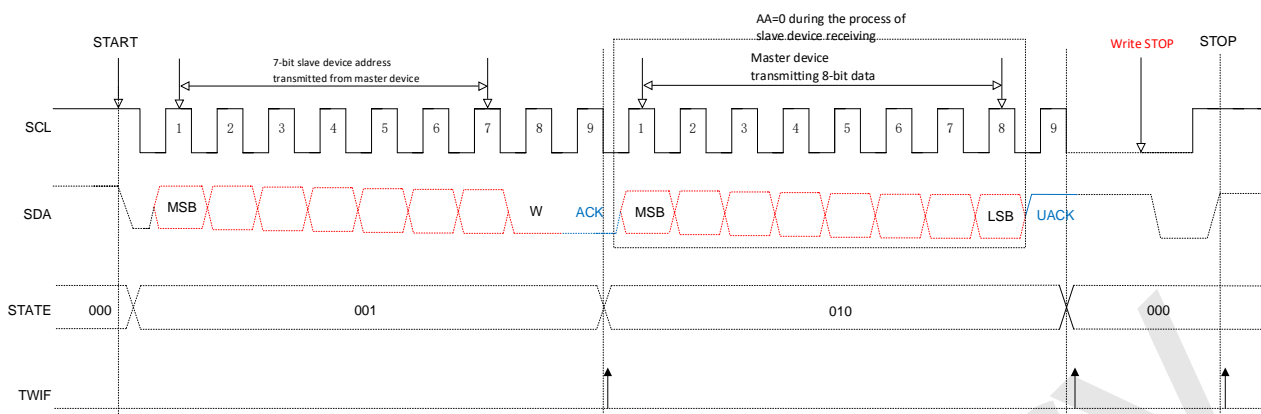

● **Non-general address response, master device transmitting mode:**

If the read and write bit received from the first frame is reading (1), the slave device will occupy the bus and send data to master device. The slave device will release the bus for transmitting every 8-bit data and wait for the response from master device:

1. If the response from master device is low level, the slave device continues to send data. During the transmitting process, if the value of AA in slave device register is rewritten to 0, the slave device will automatically end the transmission and release the bus after transmitting current bytes, and wait for stop signal or restart signal of the master device(STATE[2: 0] = 101).

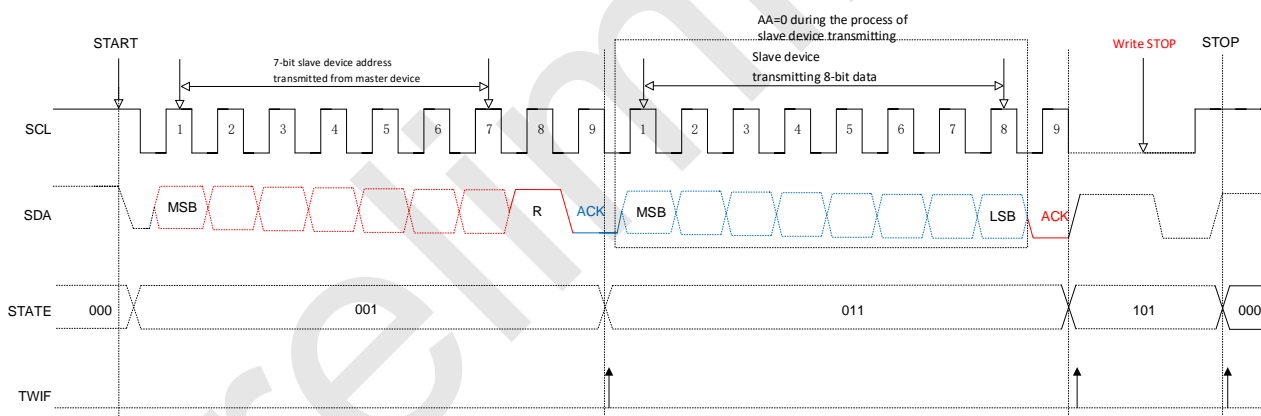

2. If the response from master device is high level, then the slave device state will wait for the stop signal or restart signal of the master device (STATE[2: 0] =100).
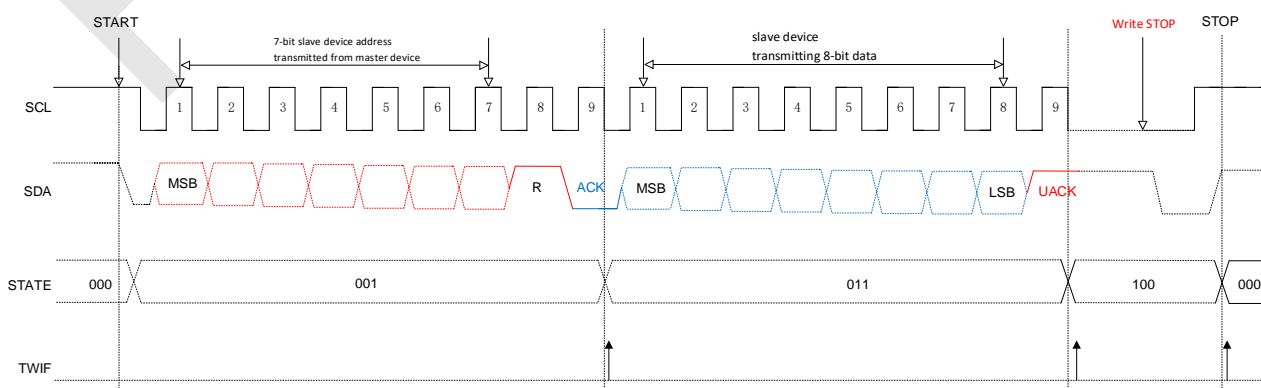

● **Response to General Address:**

When GC=1, general address is allowed to be used. When the slave device enters into the state of receiving first frame address (STATE[2: 0] = 001), the address bit data received in first frame data will be 0x00, at this time, all slave device will respond the master device. The read and write bit sent from master device must be write (0), all slave device will enter into the state of receiving data (STATE[2: 0] = 010). The master device will release SDA line for transmitting every 8-bit data and read the state on SDA line:

1. If any response from slave device occurs, there are three modes of master device communication, as shown below:

   1) Continue to transmit data;

   2) Restart;

   3) Transmit the stop signal and end this communication.

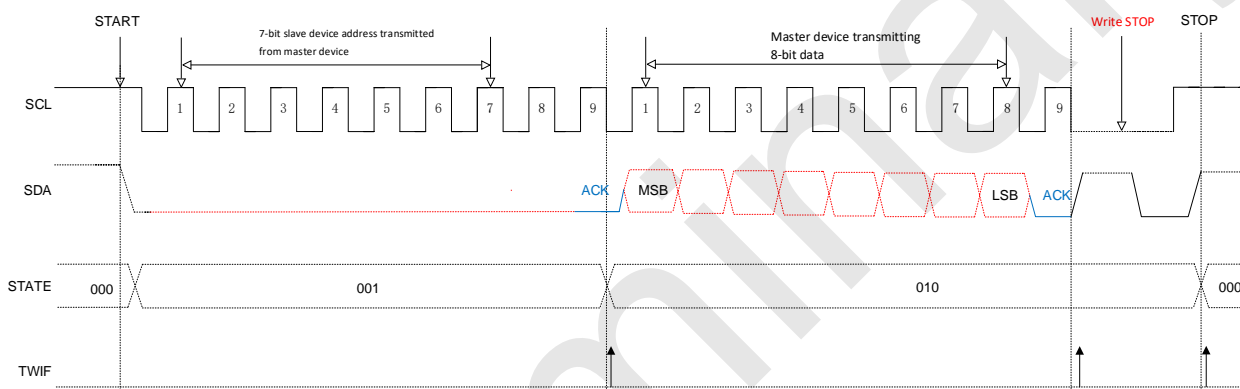

2. If there is no response from slave device, SDA will be in idle state.

**Note: When using general address under the mode of one master and multiple slaves, the read and write bit sent by master device can not be read (1) status, or else, all the other devices on the bus will also transmit response except for equipment transmitting data.**

### 17.2.3 Operating Steps

The operating steps of TWI in SSI are shown below:

① Configure SSMOD[1: 0] and select TWI mode;

② Configure SSCON0 TWI control register;

③ Configure SSCON1 TWI address register;

④ If the slave device receives data, wait for interrupt flag bit TWIF in SSCON0 to be set. The interrupt flag bit will be set to 1 when the slave device receives every 8-bit data. The interrupt flag bit shall be cleared by the user manually;

⑤ If the slave device transmits data, write the data to be transmit into TWDAT, TWI will transmit the data automatically. Interrupt flag bit TWIF will be set to 1 for transmitting every 8 bits.

## 17.3 Serial Interface 1 (UART1)

SSMOD[1: 0] = 11, SSI is configured as UART interface.

# 18 Analog-to-Digital Converter (ADC)

The SC92F854X has a 12-bit high-precision successive approximation ADC with 17-channel, the external 16 ADC channel is multiplexing with other IO ports. Cooperating with the internal 2.4V reference voltage, one internal channel connected to 1/4 $V_{DD}$ can be used for measuring $V_{DD}$ voltage.

There are 2 options for ADC reference voltage:

①   VDD pin (internal $V_{DD}$);

②   Precise 2.4V reference output from internal Regulator (at this time, MCU supply voltage VDD can not be lower than 2.9V).

**Note: $f_{ADC}$ is directly obtained by internal $f_{HRC}$ frequency division. When configuring, the user should pay attention that the clock frequency $f_{ADC}$ of ADC cannot be greater than the frequency $f_{SYS}$ of system clock, otherwise, ADC conversion results will be abnormal!**

## 18.1 ADC-related Registers

**ADCCON (ADH) ADC Control Register (Read/Write)**

| Bit Number | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit Mnemonic | ADCEN | ADCS | EOC/ADCIF | ADCIS[4: 0] | | | | |

## 18.2 ADC Conversion Steps

Operating steps for the user to practically conduct ADC conversion are shown below:

① Configure ADC input pin; (configure corresponding bit of AINx as ADC input, in general, ADC pin will be prefixed);

② Configure ADC reference voltage Vref and ADC conversion frequency;

③ Enable ADC;

④ Select ADC input channel; (Configure ADCIS bit and select ADC input channel);

⑤ Enable ADCS, and start conversion;

⑥ Wait for EOC/ADCIF=1, if ADC interrupt is enabled, ADC interrupt will be generated and the user shall clear EOC/ADCIF flag to 0 by software;

⑦ Obtain 12-bit data from ADCVH, ADCVL from high bit to low bit, and complete a conversion

⑧ If no change in input channel, repeat Step 5 to Step 7 for next conversion.

**Note: Before setting up IE[6] (EADC), it is recommended for the user to use software to clear the EOC/ADCIF flag first. After completing ADC interrupt service process, user shall eliminate EOC/ADCIF to avoid generating ADC interrupt constantly.**
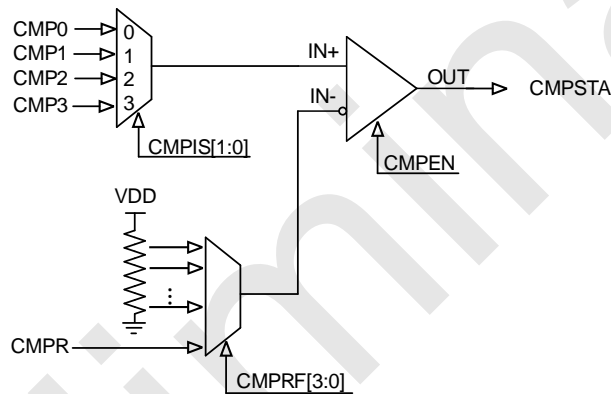

# 19 Analog comparator

SC92F854X has a built-in analog comparator, which can be used in alarm circuit, power supply voltage monitoring circuit, zero crossing detection circuit, etc.

This comparator has four analog signal positive inputs: CMP0~3, which can be switched and selected by CMPIS [1:0]. The negative input terminal voltage can be switched to one of the external voltage on the CMPR pin or the internal 16-stage comparison voltage via CMPRF[3:0].

The interrupt mode of the comparator can be conveniently set through CMPIM[1:0]. When the interrupt condition set by CMPIM[1:0] occurs, the comparator interrupt flag CMPIF will be set to 1, which needs software to clear.

# 20 High sensitivity capacitance TouchKey ciruit

The SC92F854X is integrated with a 31-channel high-sensitivity capacitive TouchKey circuit, which can be applied to TouchKey application featuring high sensitivity requirements including TouchKey sensor, proximity sensing, etc. High-flexibility development software library is provided for support with low development difficulty.

# 21 EEPROM and IAP Operations

There are two options for the SC92F854X IAP operating scope:

EEPROM and IAP operating modes are shown below:

1. Internal highest address 128 bytes EEPROM can be used as data storage;

2. The whole 32K bytes of IC ROM and 128 bytes of EEPROM can be used for IAP operations, which is mainly used for remote program updating.

As Code Option, the user shall select IAP operating space before it is written to IC by programmer:

**OP_CTM1 (C2H@FFH) Customer Option Register 1 (Read/Write)**

## 21.2 EEPROM / IAP OPerating procedures:

Writing procedure of the SC92F854X EEPROM/IAP are shown below:

① Write 0x00 into IAPADE[7: 0]: select Code memory and conduct IAP operation; write 0x02 into IAPADE[7: 0]: select EEPROM and conduct EEPROM reading and writing operations;

② Write data into IAPDAT[7: 0] (data for EEPROM / IAP writing ready);

③ Write address into {IAPADR[14: 8], IAPADR[7: 0]} (target address of EEPROM/IAP operation ready);

④ Write a nonzero value n into IAPKEY[7: 0] (switch on protection of EEPROM / IAP, and EEPROM / IAP function will be switched off when there is no writing command within n system clocks);

⑤ Write CPU Hold time into IAPCTL[3: 0] (configue CPU Hold time by setting CMD[1: 0] to 1 or 0, CPU is Hold up and start up EEPROM/IAP writing);

⑥ EEPROM/IAP writing ends, CPU proceeds to subsequent operations.

**Notes:**

1. **When programming IC, if "Code memory Prohibits IAP Operations" is selected by Code Option, IAP is unavailable upon IAPADE[7: 0]=0x00 (Select Code memory), meaning it is unable to write data, and such data can only be read by MOVC command.**

2. **When IAPADE=0x01 or 0x02, MOVC instruction and writing operation are conducted in EEPROM or IFB data memory. If any interrupt occurs and there are also MOVC operations in this interrupt, it may result in error of MOVC operations and thus abnormal operation of program. To avoid such situation, the user shall disable global interrupt control bit (EA=0) before conducting IAPADE=0x01 or 0x02 operations. After operation completed, configure IAPADE =0x00 and enable global interrupt control bit (EA=1).**

### 21.2.1 128 bytes Independent EEPROM Operating Demo program

```
#include "intrins.h"

unsigned char EE_Add;

unsigned char EE_Data;

unsigned char code * POINT =0x0000;
```

C Demo Program of EEPROM Write Operation:

```

C Demo Program of IAP Read Operation:

```
IAPADE = 0x00;                     //Select Code memory

IAP_Data = * ( POINT+IAP_Add);     //Read value in IAP_Add to IAP_Data
```

**Note: IAP operation in 32K bytes Code memory has certain risks, the user shall implement corresponding safety measures in software. Incorrect operation may result in the user program to be rewritten! Unless such function is required by the user (such as used for remote program update, etc.), it is not recommended to used by the user.**

# 22 CheckSum Module

The SC92F854X is equipped with a check sum module, which is used for generating 16-bit check sum of code memory in real time. The user can compare such check sum with theoretical value to monitor whether the contents in code memory are correct.

**Note:** **Check sum is the sum of data in the whole code memory, which is the data of 0000H ~ 7FFDH address unit. If there are residual values from the user's last operations in address unit, it may result in inconsistency of check sum with theoretical value. Therefore, it is recommended that the user shall erase the whole Code memory or write 0 before programming code so as to guarantee the consistency between check sum and theoretical value.**

## 22.1 CheckSum-Related Registers

**CHKSUML (FCH) Check Sum Result Register Low Bit (Read/Write)**

| Bit Number | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

# 23 Electrical Characteristics

## 23.1 Absolute Maximum Ratings

| Symbol | Parameter | Min Value | Max Value | Unit |
|--------|-----------|-----------|-----------|------|
| VDD/VSS | DC supply voltage | -0.3 | 5.5 | V |
| Voltage ON any Pin | Input/output voltage of any pin | -0.3 | $V_{DD}$+0.3 | V |
| $T_A$ | Ambient temperature | -40 | 85 | ℃ |
| $T_{STG}$ | Storage temperature | -55 | 125 | ℃ |

## 23.2 Recommended Operating Conditions

| Symbol | Parameter | Min Value | Max Value | Unit | System Clock Frequency |
|--------|-----------|-----------|-----------|------|------------------------|
| $V_{DD1}$ | Operating voltage | 2.9 | 5.5 | V | 16MHz |
| $V_{DD2}$ | Operating voltage | 2.4 | 5.5 | V | 8/4/1.33MHz |
| $T_A$ | Ambient temperature | -40 | 85 | ℃ | |

## 23.3 DC Characteristics

### 23.3.1 VDD = 5V, TA = +25℃, unless otherwise specified

| Symbol | Parameter | Min Value | Typical Value | Max Value | Unit | Testing Conditions |
|--------|-----------|-----------|---------------|-----------|------|--------------------|
| Current | | | | | | |
| $I_{op1}$ | Operating current | - | 9.5 | - | mA | $f_{SYS}$=16MHz |

| $I_{op2}$ | Operating current | - | 6.5 | - | mA | $f_{SYS}$=8MHz |
|---|---|---|---|---|---|---|
| $I_{op3}$ | Operating current | - | 5.2 | - | mA | $f_{SYS}$=4MHz |
| $I_{op4}$ | Operating current | - | 4.3 | - | mA | $f_{SYS}$=1.33MHz |
| $I_{pd1}$ | Standby Current (Power Down Mode) | - | 0.7 | 1.0 | µA | |
| $I_{IDL1}$ | Standby Current (IDLE Mode) | - | 7 | - | mA | |
| $I_{BTM}$ | Base Timer Operating Current | - | 6 | 10 | µA | BTMFS[3: 0]= 1000 One interrupt occurs for every 4.0 seconds |
| $I_{WDT}$ | WDT Current | - | 5 | 7 | µA | WDTCKS[2: 0]= 000 WDT overflows every 500ms |
| $I_{TK1}$ | TouchKey operating current (High Sensitivity Mode) | - | 1 | 1.2 | mA | |
| IO Port Features | | | | | | |
| $V_{IH1}$ | Input high voltage | $0.7V_{DD}$ | - | $V_{DD}$+0.3 | V | |
| $V_{IL1}$ | Input low voltage | -0.3 | - | $0.3V_{DD}$ | V | |
| $V_{IH2}$ | Input high voltage | $0.8V_{DD}$ | - | $V_{DD}$ | V | Schmidt trigger input: |
| $V_{IL2}$ | Input low voltage | -0.2 | - | $0.2V_{DD}$ | V | RST/tCK/SCK |
| $I_{OL1}$ | Output low current | - | 27 | - | mA | $V_{Pin}$=0.4V |

| $I_{OL2}$ | Output low current | - | 50 | - | mA | $V_{Pin}$=0.8V |
|---|---|---|---|---|---|---|
| $I_{OH1}$ | Output high current P3H-P5 | - | 17 | - | mA | $V_{Pin}$=4.3V |
| $I_{OH2}$ | Output high current P3H-P5 | - | 8 | - | mA | $V_{Pin}$=4.7V |
| $I_{OH3}$ | Output high current P0-P3L | - | 17 | - | mA | $V_{Pin}$=4.3V  Pxyz=0,$I_{OH}$ level 0 |
| | Output high current P0-P3L | - | 13 | - | mA | $V_{Pin}$=4.3V  Pxyz=1,$I_{OH}$ level 1 |
| | Output high current P0-P3L | - | 10 | - | mA | $V_{Pin}$=4.3V  Pxyz=2,$I_{OH}$ level 2 |
| | Output high current P0-P3L | - | 5 | - | mA | $V_{Pin}$=4.3V  Pxyz=3,$I_{OH}$ level 3 |
| $I_{OH4}$ | Output high current P0-P3L | - | 8 | - | mA | $V_{Pin}$=4.7V  Pxyz=0,$I_{OH}$ level 0 |
| | Output high current P0-P3L | - | 6 | - | mA | $V_{Pin}$=4.7V  Pxyz=1,$I_{OH}$ level 1 |
| | Output high current P0-P3L | - | 4 | - | mA | $V_{Pin}$=4.7V  Pxyz=2,$I_{OH}$ level 2 |
| | Output high current P0-P3L | - | 2 | - | mA | $V_{Pin}$=4.7V  Pxyz=3,$I_{OH}$ level 3 |
| $R_{PH1}$ | Pull-up resistance | - | 30 | - | kΩ | |
| Internal calibrated 2.4V as ADC reference voltage | | | | | | |

| Symbol | Parameter | Min Value | Typical Value | Max Value | Unit | Testing Conditions |
|--------|-----------|-----------|---------------|-----------|------|--------------------|
| $V_{DD24}$ | Internal reference 2.4V voltage output | 2.37 | 2.40 | 2.45 | V | $T_A$=-40~85℃ |

## 23.3.2 VDD = 3.3V, TA = +25℃, unless otherwise specified

| Symbol | Parameter | Min Value | Typical Value | Max Value | Unit | Testing Conditions |
|--------|-----------|-----------|---------------|-----------|------|--------------------|
| Current | | | | | | |
| $I_{op5}$ | Operating current | - | 6.5 | - | mA | $f_{SYS}$=16MHz |
| $I_{op6}$ | Operating current | - | 5 | - | mA | $f_{SYS}$=8MHz |
| $I_{op7}$ | Operating current | - | 4 | - | mA | $f_{SYS}$=4MHz |
| $I_{op8}$ | Operating current | | 3.3 | - | mA | $f_{SYS}$=1.33MHz |
| $I_{pd2}$ | Standby Current (Power Down Mode) | - | 0.6 | 1 | uA | |
| $I_{IDL2}$ | Standby Current (IDLE Mode) | - | 5 | - | mA | |
| $I_{TK2}$ | TouchKey operating current (High Sensitivity Mode) | - | 0.9 | 1.1 | mA | |
| I/O Port Features | | | | | | |
| $V_{IH3}$ | Input high voltage | $0.7V_{DD}$ | - | $V_{DD}$+0.3 | V | |
| $V_{IL3}$ | Input low voltage | -0.3 | - | $0.3V_{DD}$ | V | |
| $V_{IH4}$ | Input high voltage | $0.8V_{DD}$ | - | $V_{DD}$ | V | Schmidt trigger input: |
| $V_{IL4}$ | Input low voltage | -0.2 | - | $0.2V_{DD}$ | V | RST/tCK/SCK |

| $I_{OL3}$ | Output low current | - | 25 | - | mA | $V_{Pin}$=0.4V |

| $I_{OL4}$ | Output low current | - | 40 | - | mA | $V_{Pin}$=0.8V |
| $I_{OH5}$ | Output high current | - | 5 | - | mA | $V_{Pin}$=3.0V |
| $R_{PH2}$ | Pull-up resistance | - | 55 | - | kΩ | |
| Internal calibrated 2.4V as ADC reference voltage | | | | | | |
| $V_{DD24}$ | Internal reference 2.4V voltage output | 2.37 | 2.40 | 2.45 | V | $T_A$=-40~85℃ |

## 23.4 AC Characteristics

($V_{DD}$ = 2.4V ~ 5.5V, TA = 25℃, unless otherwise specified)

| Symbol | Parameter | Min | Typical | Max | Unit | Conditions |
|---|---|---|---|---|---|---|
| $T_{OSC}$ | External 32K oscillator start-up time | - | - | 1 | s | External 32K crystal oscillator |
| $T_{POR}$ | Power On Reset time | - | 5 | 10 | ms | |
| $T_{PDW}$ | Power Down Mode waking-up time | - | 1 | 1.5 | ms | |
| $T_{Reset}$ | Reset Pulse Width | 18 | - | - | µs | Valid for Low level |
| $f_{HRC}$ | RC oscillation stability | 15.84 | 16 | 16.16 | MHz | $V_{DD}$=3.0~5.5V $T_A$=-20~85 ℃ |

## 23.5 ADC Characteristics

($T_A$= 25℃, unless otherwise specified)

| Symbol | Parameter | Min | Typical | Max | Unit | Conditions |
|---|---|---|---|---|---|---|
| $V_{AD}$ | Supply Voltage | 2.4 | 5.0 | 5.5 | V | |
| $N_R$ | Precision | - | 12 | - | bit | $GND ≤ V_{AIN} ≤ V_{DD}$ |
| $V_{AIN}$ | ADC Input Voltage | GND | - | $V_{DD}$ | V | |
| $R_{AIN}$ | ADC input resistance | 1 | - | | MΩ | $V_{IN}$=5V |
| $I_{ADC1}$ | ADC conversion current 1 | - | - | 2 | mA | ADC Module on $V_{DD}$=5V |
| $I_{ADC2}$ | ADC conversion current 2 | - | - | 1.8 | mA | ADC module on $V_{DD}$=3.3V |
| DNL | Differential nonlinear error | - | ±2 | - | LSB | $V_{DD}$=5V $V_{REF}$=5V |
| INL | Integral nonlinear error | - | ±2 | - | LSB | |
| $E_Z$ | Offset error | - | 1 | - | LSB | |
| $E_F$ | Full scale error | - | 35 | - | LSB | |
| $E_{AD}$ | Total absolute error | - | 35 | - | LSB | |
| $T_{ADC1}$ | ADC conversion time 1 | - | 7.5 | - | µs | ADC Clock = 2.67MHz  ADC sampling period = 6 |
| $T_{ADC2}$ | ADC conversion time 2 | - | 15 | - | µs | ADC Clock = 1.33MHz  ADC sampling period = 6 |

## 23.6 Analog Comparator Characteristics

($V_{DD}$ =5V, $T_A$ = 25℃, unless otherwise specified)

| Symbol | Parameter | Min | Typical | Max | Unit | Conditions |
|--------|-----------|-----|---------|-----|------|------------|
| $V_{CM}$ | Common Mode Input Voltage | 0 | - | $V_{DD}$ | V | |
| $V_{OS}$ | Input Offset voltage | - | 10 | 30 | mV | |
| $V_{HYS}$ | Hysteresis voltage | - | 25 | - | mV | |
| $I_{CMP}$ | Comparator conversion current | - | - | 100 | µA | $V_{DD}$=5V |
| $T_{CMP}$ | Response time | - | - | 2 | µs | |
