

High-speed 1T 8051-based Flash MCU, 1 Kbytes SRAM, 8 Kbytes Flash, 128 bytes independent EEPROM, 23-channel low-power dual-mode TouchKey module, 12-bit ADC, Six 10-bit PWM Outputs, 3 Timer/Counters, MDU, UART, SSI, CheckSum module

1 General Description

The SC92F8363B/8362B/8361B (hereinafter referred to as the SC92F836XB) is a kind of enhanced high-speed 1T 8051-based industrial Flash Microcontroller unit (MCU) with integrated TouchKey function, in which the instruction system is completely compatible with standard 8051 product series.

The SC92F836XB has a 23-channel dual-mode capacitor TouchKey circuit with low power consumption. The TouchKey circuit can be operated under STOP Mode.

The SC92F836XB is integrated with 8K bytes Flash ROM, 1K bytes SRAM, 128 bytes EEPROM, up to 26 General-purpose I/Os (GPIO), 13 IO external interrupters, three 16-bit timers, 11-channel 12-bit high-precision ADC, 6-channel independent 10-bit PWM, internal $\pm 1\%$ high-precision 12/6/2MHz high-frequency oscillator and 4% precision low-frequency 128K oscillator, external crystal oscillator interface, one separate UART, one three-in-one serial communication interface which can be used as UART/SPI/TWI (SSI). To improve the reliability and simplify the circuit design, the SC92F836XB is also built in with 4-level optional LVR voltage, 2.4V ADC reference voltage and other high-reliability circuits.

The SC92F836XB features excellent anti-interference performance, which make it possible to be widely applied to industrial control system, such as intelligent home appliances, home automation, Internet of Things, wireless communication, gaming peripherals and consumer applications.

2 Features

Operating Voltage: 2.4V ~ 5.5V

Operating Temperature: -40 ~ 85°C

Package:

SC92F8363B (SOP28/TSSOP28)

SC92F8362B (SOP20/TSSOP20)

SC92F8361B (SOP16)

Core: 1T 8051

Flash ROM: 8K bytes Flash ROM (MOVC) prohibited addressing 0000H ~ 00FFH) can be rewritten for 10,000 times

IAP: Code option into 0K, 0.5K, 1K or 8K

EEPROM: 128 bytes EEPROM can be rewritten for 100,000 times. The data written-in has more than 10-year preservation life.

SRAM: Internal 256 bytes + external 768 bytes

System Clock (f_{SYS}):

- Built-in high-frequency 24MHz oscillator (f_{HRC}):
 - As the system clock source, f_{SYS} can be set to 12/6/2MHz by programmer selection.
 - Frequency Error: Suitable for 3.0V ~ 5.5V and -20 ~ 85°C application environment, no more than $\pm 1\%$ of frequency error
- Built-in high-frequency Crystal Oscillator Circuit
 - Available to externally connect 2-16 MHz Oscillator
 - As the source of system clock, f_{SYS} can be set to $/2$, $/4$ or $/12$ of the frequency of oscillator via code option.
- Operating voltage at different system frequency:
 - $>12\text{MHz}$ @2.9 ~ 5.5V
 - $\leq 12\text{MHz}$ @2.4 ~ 5.5V

Built-in Low-Frequency 128kHz Oscillator (LRC):

- Clock source of Base Timer (BTM), which can wake up the SC92F836XB from stop mode
- Clock source of Watchdog (WDT)
- Frequency Error: 4.0V ~ 5.5V and -20 ~ 85°C application environment, no more than $\pm 4\%$ of frequency error

Low-voltage Reset (LVR):

- 4-level LVR voltage options: 4.3V, 3.7V, 2.9V,

2.3V

- The default is the Code Option value selected by the user

Flash Programming and Emulation:

- 2-wire JTAG programming and emulation interface

Interruption (INT):

- 12 interrupt sources: Timer0, Timer1, Timer2, INT0 ~ 2, ADC, PWM, UART, SSI, Base Timer and TK
- 3 external interrupt vectors shared by 13 interrupt ports, all of which can be defined in rising-edge, falling-edge or dual-edge trigger mode.
- Two-level interrupt priority capability

Digital Peripheral:

- Up to 26 bidirectional independently controllable I/O interfaces, able to configure pull-high resistor independently
- P0/P2 ports with 4-level drive capability
- All I/Os equipped with sink current drive capability (70 mA)
- 11-bit WDT with optional clock division ratio
- 3 standard 80C51 Timer/Counters: Timer0, Timer1 and Timer2
- Timer2 can be set to capture mode
- Six 10-bit PWM output channels with variable period and individual duty cycle, which can simultaneously output three sets of complementary PWM waveforms with dead zone
- 5 I/Os as output of the 1/2-bias LCD COM
- 1 independent UART communication interface (Switchable I/O port)
- 1 three-in-one serial communication interface

(SSI) (Switchable I/O port)

- 16*16-bit hardware multiplier and divider unit (MDU)

Analog Peripheral:

- The 23-channel dual-mode TouchKey (TK) circuit with low power consumption can be configured in high sensitivity mode or high reliability mode:

- High-sensitivity mode applicable to TouchKey sensor, proximity induction and other TouchKey applications featuring high requirements on sensitivity
- High reliability mode features very strong anti-interference which is able to pass 10V dynamic CS test
- Implementing 23-channel high-sensitivity TouchKeys and derivative functions
- High-flexibility development with software library support to reduce development difficulty
- Supporting automatic debugging software and intelligent development
- When scanning with a single TouchKey in stop mode, the overall power consumption of the chip can be as low as 11uA

- 11-channel 12-bit ± 2 LSB ADC
 - Built-in 2.4V reference voltage
 - 2 options for ADC reference voltage: V_{DD} and internal 2.4V
 - Internal one-channel ADC, where V_{DD} can be measured directly
 - ADC conversion completion interrupt

Power Saving Mode:

- IDLE Mode: can be woken up by any interrupt.
- STOP Mode: can be woken up by INT0 ~ 2, Base Timer and TK

Naming Rules for 92 Series Products

Name	SC	92	F	8	3	6	3	B	M	28	U
S/R	①	②	③	④	⑤	⑥	⑦	⑧	⑨	⑩	⑪

S/R	Meaning
①	SinOne Chip abbreviation
②	Name of product series
③	Product Type (F: Flash MCU)
④	Serial Number: 7: GP Series, 8: TK series
⑤	ROM Size: 1 for 2K, 2 for 4K, 3 for 8K, 4 for 16K and 5 for 32K...
⑥	Subseries Number.: 0 ~ 9, A ~ Z
⑦	Number of Pins: 0: 8pin, 1: 16pin, 2: 20pin, 3: 28pin, 5: 32pin, 6: 44pin, 7: 48pin, 8: 64pin, 9: 100pin
⑧	Version Number: (default, B, C, D)
⑨	Package Type: (D: DIP; M: SOP; X: TSSOP; F: QFP; P: LQFP; Q: QFN; K: SKDIP)
⑩	Number of Pins.
⑪	Packaging Mode: (U: Tube; R: Tray; T: Reel)

4 Inner BLOCK Diagram

The SC92F836XB BLOCK DIAGRAM

5 Flash ROM and SRAM Structure

The structures of the SC92F836XB's Flash ROM and SRAM are shown as follows:

Flash ROM and SRAM Structure Diagram

5.1 Flash ROM

The SC92F836XB provides 8 Kbytes of Flash ROM with the ROM address of 0000H ~ 1FFFH. These 8 Kbytes of Flash ROM can be rewritten 10,000 times, which is able to program and erase by specialized ICP programming device (SOC PRO52/DPT52/SC LINK) provided by SinOne.

The MOVC instruction is non-addressable within 256 bytes (address of 0000H ~ 00FFH). That is to say, it is unable to read the contents of the 256 bytes region by program, so as to realize the encryption function of chip program. For more details, refer to "SinOne SC92F Series MCU Application Guide".

EEPROM is an data memory separated from 8K bytes ROM with the address of 00H ~ 7FH, which can be accessed by single-byte reading and writing operations in the program; for more details, refer to [20 EEPROM and IAP Operations](#). Note: The number of erasure of EEPROM is 100,000 times. The user should not exceed the rated burn number of EEPROM, otherwise there will be an exception!

The SC92F836XB 8 Kbytes Flash ROM provide Empty Check, Program, Verify and Erase function other than Read function. This Flash ROM and EEPROM usually needs no Erase operation before writing. Directly writing data can realize coverage of new data.

The SC92F836XB Flash ROM can be programmed by tDIO, tCK, VDD and VSS, with its specific connection shown as follows:

ICP Mode Flash Writer Programming Connection Diagram

5.2 Customer Option Memory (User Programming Setting)

A separate Flash data memory is embedded inside the SC92F836XB, called Code Option area, to save the user's presets. These presets will be written into IC when programming and loaded into SFR as default values during reset.

Option-related SFR Operating Instructions:

Reading and writing operations to option-related SFR are controlled by both register OPINX and register OPREG, with its respective address of Option SFR depending on register OPINX, as shown below:

Symbol	Address	Description	7	6	5	4	3	2	1	0
OP_HRCR	83H@FFH	System Clock Change Register	OP_HRCR[7: 0]							
OP_CTM0	C1H@FFH	Customer Option Register 0	ENWDT	ENXTL	SCLKS[1: 0]		DISRST	DISLVR	LVRS[1: 0]	
OP_CTM1	C2H@FFH	Customer Option Register 1	VREFS	XTLHF	-	-	IAPS[1: 0]		-	-

OP_HRCR (83H@FFH) System Clock Change Register (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	OP_HRCR[7: 0]							

R/W	R/W							
POR	n	n	n	n	n	n	n	n

Bit Number	Bit Mnemonic	Description
7 ~ 0	OP_HRCR[7: 0]	Internal high-frequency RC frequency adjustment Central value 10000000b corresponds to HRC central frequency, the larger the value is, the faster the frequency will be, vice versa.

OP_CTM0 (C1H@FFH) Customer Option Register0 (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	ENWDT	ENXTL	SCLKS[1: 0]		DISRST	DISLVR	LVRS[1: 0]	
R/W	R/W	R/W	R/W		R/W	R/W	R/W	
POR	n	n	n		n	n	n	

Bit Number	Bit Mnemonic	Description
7	ENWDT	Watchdog (WDT) control bit (This bit is transferred by the system to the value set by the user Code Option) 0: WDT invalid 1: WDT valid (WDT stops counting during IAP execution)
6	ENXTL	External High-Frequency crystal oscillator selection bit 0: External High-Frequency crystal Interface disable, P5.0 and P5.1 valid 1: External High-Frequency crystal Interface enable, P5.0 and P5.1 invalid

5 ~ 4	SCLKS[1: 0]	System clock frequency selection bits 00: Reserved; 01: System clock frequency is HRC frequency divided by 2; 10: System clock frequency is HRC frequency divided by 4; 11: System clock frequency is HRC frequency divided by 12;
3	DISRST	IO/RST selection bit 0: configure P1.1 as External Reset input pin 1: configure P1.1 as GPIO
2	DISLVR	LVR control bit 0: LVR valid 1: LVR invalid
1 ~ 0	LVRs [1: 0]	LVR voltage selection bits 11: 4.3V reset 10: 3.7 V reset 01: 2.9V reset 00: 2.3 V reset

OP_CTM1 (C2H@FFH) Customer Option Register1 (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	VREFS	XTLHF	-	-	IAPS[1: 0]		-	-
R/W	R/W	R/W	-	-	R/W	R/W	-	-
POR	n	n	x	x	n	n	x	x

Bit Number	Bit Mnemonic	Description
7	VREFS	Reference voltage selection bit (Initial values are configured by the user and loaded from Code Options) 0: Configure ADC VREF as V_{DD} 1: Configure ADC VREF as internally correct 2.4V
6	XTLHF	External clock source frequency mode register selection bit 0: Match with the external clock source which frequency <12M 1: Match with the external clock source which frequency \geq 12M
3 ~ 2	IAPS[1: 0]	EEPROM and IAP Area Selection Bits 00: Code memory prohibits IAP operations, only EEPROM data memory is used for data storage 01: last 0.5k code memory allows IAP operation (1E00H ~ 1FFFH) 10: Last 1k code memory allows IAP operation (1C00H ~ 1FFFH) 11: All code memory allows IAP operation (0000H ~ 1FFFH)
5 ~ 4, 1 ~ 0	-	Reserved

5.2.1 Customer-Option-related Registers Operation Instructions

Option-related SFRs reading and writing operations are controlled by both OPINX and OPREG registers, with their respective position of Option SFR depending on OPINX and its value written to option-related SFR depending on register OPREG:

Symbol	Address	Description		POR
OPINX	FEH	Option Pointer	OPINX[7: 0]	00000000b
OPREG	FFH	Option Register	OPREG[7: 0]	nnnnnnnb

When operating Option-related SFRs, register OPINX stores the address of option-related registers and register OPREG stores corresponding value.

For example: To configure OP_HRCR as 0x01, specific operation method is shown below:

C program example:

```
OPINX = 0x83;           //Write OP_HRCR address into OPINX register
```

```
OPREG = 0x01;           //Write 0x01 into OPREG register (the value to be written into OP_HRCR register)
```

Assembler program example:

```
MOV OPINX, #83H         ;Write OP_HRCR address into OPINX register
```

```
MOV OPREG, #01H        ;Write 0x01 into OPREG register (the value to be written into OP_HRCR register)
```

Note: It is forbidden to write any value beyond SFR address of Customer Option region into OPINX register! Or else, it may cause abnormal system operation.

5.3 SRAM

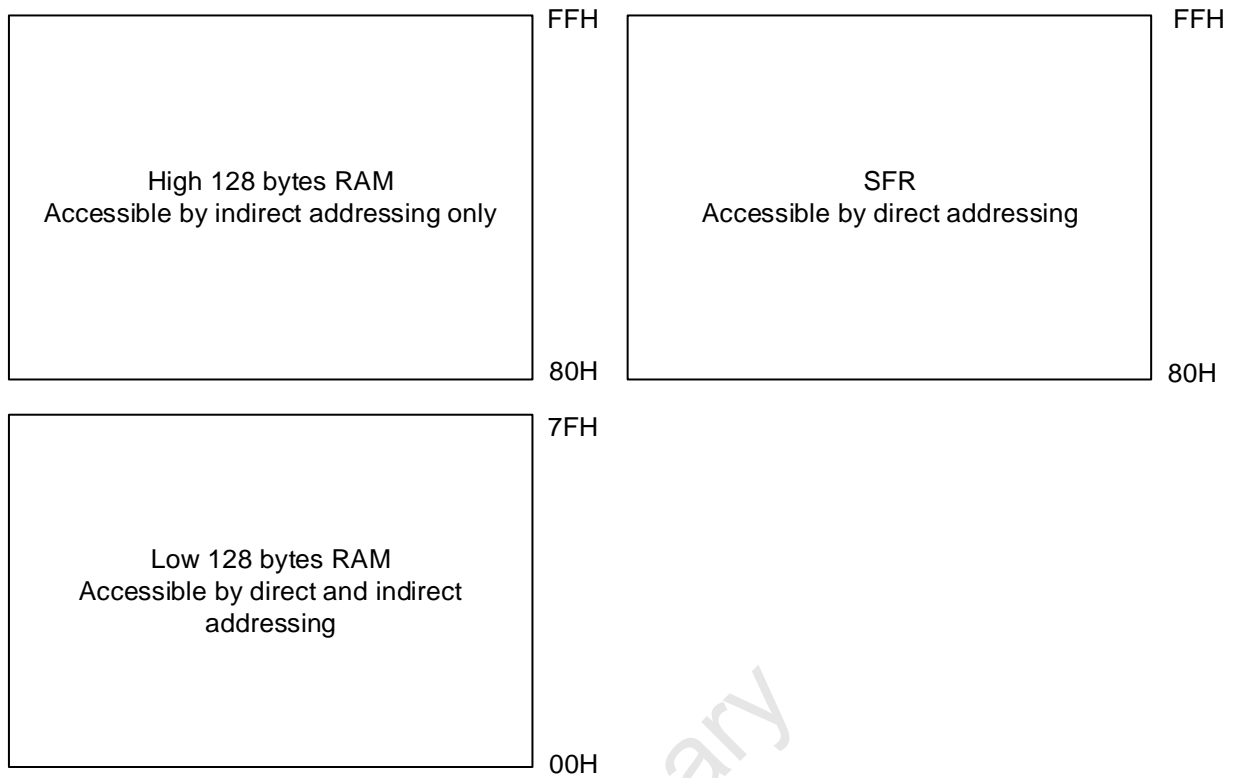

The SC92F836XB Microcontroller Unit, which integrates SRAM of 1 Kbytes, is divided into internal 256 bytes RAM and external 768 bytes RAM. The address of Internal RAM range from 00H to FFH, including high 128 bytes (address of from 80H to FFH) only addressed indirectly and low 128 bytes (address of from 00H to 7FH) addressed both directly and indirectly).

The address of SFRs is also from 80H to FFH. But the difference between SFR and internal high 128 bytes SRAM is that the former is addressed directly but the latter addressed indirectly only.

The address of External RAM from 0000H to 02FFH, which is addressed by MOVX instruction.

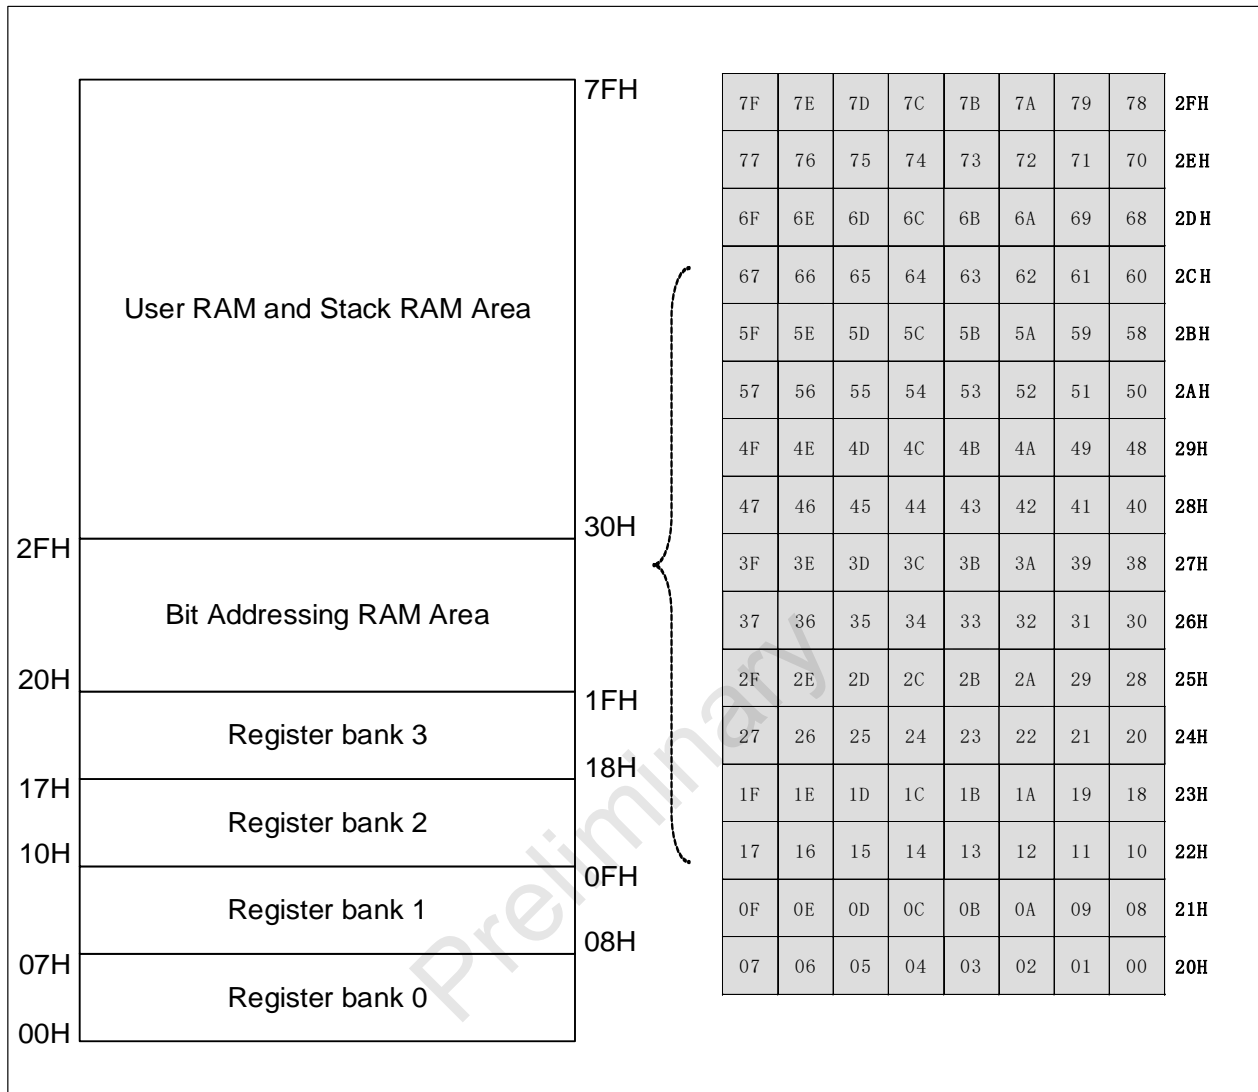

5.3.1 Internal 256 bytes SRAM

Internal low 128 bytes SRAM area is divided into three parts: ① Register bank 0 ~ 3, address from 00H to 1FH. The active bank is selected by bits RS1 and RS0 of PSW register. Using Register bank 0 ~ 3 can accelerate arithmetic speed; ② Bit addressing area, 20H ~ 2FH; user can use it as normal RAM or bitwise addressing RAM; for the latter, the bit address is from 00H to 7FH (bitwise addressing is different from normal SRAM byte-oriented addressing), which can be distinguished by instructions in program; ③ User RAM and stack area, the 8-bit stack pointer will point to stack area after the SC92F836XB reset; in general, users can set initial value in initializer, which is recommended to configure in the unit interval from E0H to FFH.

Internal 256 bytes RAM Structure Diagram

Internal low 128 bytes RAM structure is shown below:

SRAM Structure Diagram

5.3.2 External 768 bytes SRAM

The external 768 bytes RAM (SRAM) can be accessed by instruction "MOVX @DPTR" or instruction MOVX A, @Ri or MOVX @Ri, A together with EXADH register. EXADH register stores high address of external SRAM; Ri register stores low 8-bit address of external SRAM.

EXADH (F7H) External SRAM Operating Address High (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	-	-	-	-	-	EXADH [1:0]		

POR	x	x	x	x	x	0	0	0
-----	---	---	---	---	---	---	---	---

Bit Number	Bit Mnemonic	Description
1 ~ 0	EXADH [1: 0]	External SRAM Address High position
7 ~ 2	-	Reserved

6 Special Function Register (SFR)

6.1 SFR Mapping

The SC92F836XB provides some registers equipped with special functions, called SFR. The address of such SFRs is from 80H to FFH, some are bit-addressable, and others are not. It is very convenient for these bit addressable registers to change the value of single bit, of which the address is end up with figure "0" or "8". All SFR shall use direct addressing for addressing.

The name and address of the SC92F836XB special function registers are shown in the table below:

	0/8	1/9	2/A	3/B	4/C	5/D	6/E	7/F
F8h	-	-	-	-	CHKSUML	CHKSUMH	OPINX	OPREG
F0h	B	IAPKEY	IAPADL	IAPADH	IAPADE	IAPDAT	IAPCTL	EXADH
E8h	-	EXA0	EXA1	EXA2	EXA3	EXBL	EXBH	OPERCON
E0h	ACC	-	-	-	-	-	-	-
D8h	P5	P5CON	P5PH	-	PWMDTYB	PWMDTY3	PWMDTY4	PWMDTY5
D0h	PSW	PWMCFG	PWMCON	PWMPRD	PWMDTYA	PWMDTY0	PWMDTY1	PWMDTY2
C8h	T2CON	T2MOD	RCAP2L	RCAP2H	TL2	TH2	BTMCON	WDTCON
C0h	-	-	-	-	-	-	INT2F	INT2R
B8h	IP	IP1	INT0F	INT0R	INT1F	INT1R	-	-

B0h	-	-	-	-	-	-	-	-
A8h	IE	IE1	ADCCFG2	ADCCFG0	ADCCFG1	ADCCON	ADCVL	ADCVH
A0h	P2	P2CON	P2PH	-	-	-	-	-
98h	SCON	SBUF	P0CON	P0PH	P0VO	SSCON0	SSCON1	SSDAT
90h	P1	P1CON	P1PH	-	-	SSCON2	-	IOHCON
88h	TCON	TMOD	TL0	TL1	TH0	TH1	TMCON	OTCON
80h	P0	SP	DPL	DPH	-	-	-	PCON
	Bit Addressable	Not Bit Addressable						

Notes:

1. Hollow space of SFR refers to the fact that there is no such register RAM, it is not recommended for user to use.
2. The address of SFR for system configuration is F1H ~ FFH, user use it may result in system exceptions. User are not allowed to conduct clearing or other operations to these registers during the system initialization process.

6.2 SFR Instructions

For a description of each SFR, see the following table:

Mnemonic	Add	Description	7	6	5	4	3	2	1	0	POR
P0	80H	P0 Data Register	P07	P06	P05	P04	P03	P02	P01	P00	0000000b

6.2.1 C51 Core SFRs

Program Counter (PC)

PC does not belong to SFR. 16-bit PC is the register used to control instruction execution sequence. After power-on or reset of microcontroller unit, PC value is 0000H, that is to say, the microcontroller unit is to execute program from 0000H.

Accumulator ACC (E0H)

Accumulator ACC is one of the commonly-used registers in 8051-based microcontroller unit, using A as mnemonic symbol in the instruction system. It is usually used to store operand and results for calculation or logical operations.

B Register (F0H)

B Register shall be used together with Accumulator A in multiplication and division operations. For example, instruction "MUL A, B" is used to multiply 8-bit unsigned numbers of Accumulator A and Register B. As for the acquired 16-bit product, low byte is placed in A and High byte in B. As for "DIV A, B" is used to divide A by B, place integer quotient in A and remainder in B. Register B can also be used as common temporary register.

Stack Pointer SP (81H)

Stack pointer is an 8-bit specialized register, it indicates the address of top stack in common RAM. After resetting of microcontroller unit, the initial value of SP is 07H, and the stack will increase from 08H. 08H ~ 1FH is address of register banks 1 ~ 3.

PSW (D0H) Program Status Word Register (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	CY	AC	F0	RS1	RS0	OV	F1	P
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
POR	0	0	0	0	0	0	0	0

Bit Number	Bit Mnemonic	Description															
7	CY	Carry Flag bit 1: The top digit of add operation has carry bit or the top digit of subtraction operation has the borrow digit 0: The top digit of add operation has no carry bit or the top digit of subtraction operation has no borrow digit															
6	AC	Carry-bit auxiliary flag bit (adjustable upon BCD code add and subtraction operations) 1: There is carry bit in bit 3 upon add operation and borrow bit in bit 3 upon subtraction operation 0: No borrow bit and carry bit															
5	F0	User flag bit															
4 ~ 3	RS1、RS0	Register banks selection bits <table border="1"> <thead> <tr> <th>RS1</th> <th>RS0</th> <th>Current Selected Register banks 0 ~ 3</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>Group 0 (00H ~ 07H)</td> </tr> <tr> <td>0</td> <td>1</td> <td>Group 1 (08H ~ 0FH)</td> </tr> <tr> <td>1</td> <td>0</td> <td>Group 2 (10H ~ 17H)</td> </tr> <tr> <td>1</td> <td>1</td> <td>Group 3 (18H ~ 1FH)</td> </tr> </tbody> </table>	RS1	RS0	Current Selected Register banks 0 ~ 3	0	0	Group 0 (00H ~ 07H)	0	1	Group 1 (08H ~ 0FH)	1	0	Group 2 (10H ~ 17H)	1	1	Group 3 (18H ~ 1FH)
RS1	RS0	Current Selected Register banks 0 ~ 3															
0	0	Group 0 (00H ~ 07H)															
0	1	Group 1 (08H ~ 0FH)															
1	0	Group 2 (10H ~ 17H)															
1	1	Group 3 (18H ~ 1FH)															
2	OV	Overflow flag bit															
1	F1	F1 flag bit User customized flag															
0	P	Parity flag bit. This flag bit is the parity value of the number of 1 in accumulator ACC. 1: Odd number of number of 1 in ACC 0: Even number of number of 1 in ACC (including 0)															

Data Pointer DPTR (82H, 83H)

The Data pointer DPTR is a 16-bit dedicated register, which is composed of Low byte DPL (82H) and High byte DPH (83H). DPTR is the only register in the traditional 8051-based MCU that can directly conduct 16-bit operation, which can also conduct operations on DPL and DPH by byte.

7 Power, Reset and System Clock

7.1 Power Circuit

The SC92F836XB Power includes circuits such as BG, LDO, POR and LVR, which are able to reliably work within the scope of 2.4V ~ 5.5V. Besides, a calibrated 2.4V voltage is built in the IC, which is used as ADC internal reference voltage. The user can search for specific configuration contents in [18 Analog-to-digital converter \(ADC\)](#).

7.2 Power-on Reset

After the SC92F836XB power-on, the processes carried out before execution of client software are as follows:

- Reset stage
- Loading information stage
- Normal operation stage

7.2.1 Reset Stage

The SC92F836XB will always be in reset mode. There will not be a valid clock until the voltage supplied to the SC92F836XB is higher than certain voltage. The duration of reset stage is related to rising speed of external power. Once the external supply voltage is up to built-in POR voltage, the reset stage would be completed.

7.2.2 Loading Information Stage

There is a preheating counter inside the SC92F836XB. During the reset stage, this preheating counter is always reset as zero. After the voltage is higher than POR voltage, internal RC oscillator starts to oscillate and this preheating counter starts to count. When internal preheating counter counts up to certain number, one byte data will be read from IFB of Flash ROM (including Code Option) for every certain number of HRC clock, which is saved to internal system registers. After the preheating is completed, such reset signal will end.

7.2.3 Normal Operating Stage

After the loading information stage has been completed, the SC92F836XB starts to read instruction code from Flash and enters normal operating stage. At this time, LVR voltage is the set value of Code Option written by user.

7.3 Reset Modes

The SC92F836XB has 4 kinds of reset modes: ① External RST reset ② Low-voltage reset (LVR) ③ Power-on reset (POR) ④ Watchdog (WDT) reset.

7.3.1 External Reset

External reset is to supply a certain width reset pulse signal to the SC92F836XB from the RST pin to realize the SC92F836XB reset.

User can configure P1.1 pin as RST (reset pin) in Customer Option via PC program software before programming.

7.3.2 Low-voltage Reset (LVR)

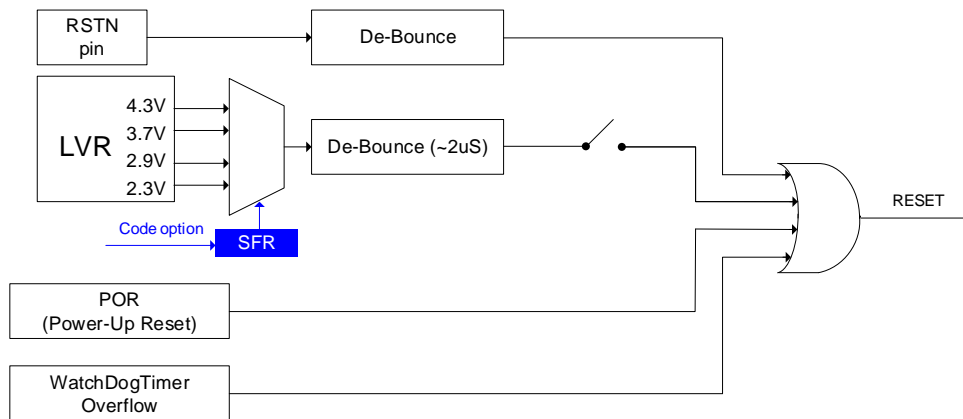

The SC92F836XB provides a low-voltage reset circuit. There are 4-level LVR voltage options: 4.3V, 3.7V, 2.9V and 2.3V. The default is the Option value written by user.

OP_CTM0 (C1H@FFH) Customer Option Register 0 (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	ENWDT	ENXTL	SCLKS[1: 0]		DISRST	DISLVR	LVRS[1: 0]	
R/W	R/W	R/W	R/W		R/W	R/W	R/W	
POR	n	n	n		n	n	n	

Bit Number	Bit Mnemonic	Description
2	DISLVR	LVR control bit 0: LVR valid 1: LVR invalid
1 ~ 0	LVRS [1: 0]	LVR voltage selection bits 11: 4.3 V reset 10: 3.7 V reset 01: 2.9 V reset 00: 2.3 V reset

The Circuit Diagram of the SC92F836XB Resetting Part is shown below:

The SC92F836XB Reset Diagram

7.3.3 Power-on Reset (POR)

The SC92F836XB provides a power-on reset circuit. When power voltage V_{DD} is up to POR reset voltage, the system will be reset automatically.

7.3.4 Watchdog Reset (WDT)

The SC92F836XB has a WDT, the clock source of which is the internal 128 kHz oscillator. User can select whether to enable Watchdog Reset function by programmer Code Option.

OP_CTM0 (C1H@FFH) Customer Option Register 0 (Read/Write)

Bit Number	7	6	5	4	3	2	1	0

001	250ms																			
010	125ms																			
011	62.5ms																			
100	31.5ms																			
101	15.75ms																			
110	7.88ms																			
111	3.94ms																			
7 ~ 5, 3	-	Reserved																		

7.3.5 Register Reset Value

During reset, most registers are set to their initial values and the WDT remains disable. The register of PORT is FFh. The initial value of program counter (PC) is 0000h, and the initial value of stack pointer SP is 07h. Reset of “Hot Start” (such as WDT, LVR, etc.) will not influence SRAM which always keep the value before resetting. The SRAM contents will be retained until the power voltage is too low to keep RAM alive.

The initial value of power-on reset in SFRs is shown in the table below:

Mnemonic	Reset value	Mnemonic	Reset value
ACC	0000000z0b	P1PH	00000000b

7.4 High-speed RC Oscillator

The SC92F836XB has a built-in adjustable high-precision HRC and a crystal oscillation circuit. The user can choose either as the system clock. HRC is precisely calibrated to 24 MHz@5V/25°C when delivery. The user can set system clock as 12/6/2MHz by programmer Code Option. The calibration process is to filter the influence of processing deviation on precision. There will be certain drifting of this HRC depending on operating temperature and voltage. As for voltage drifting (3.0V ~ 5.5V) and temperature drifting (-20°C ~ 85°C), the deviation is within ±1%.

In order to enhance the reliability of the system, the SC92F836XB has a system clock monitoring circuit built in. When user chooses the crystal oscillation as system clock source and the crystal oscillation circuit stops oscillating, the system clock source will be automatically switched to the built-in HRC, and this state will be maintained until the next reset.

Note: The clock source of ADC and dual mode TouchKey circuit is $f_{HRC} = 24\text{MHz}$, which is independent of switch of system clock.

The SC92F836XB Internal Clock Relationship

OP_CTM0 (C1H@FFH) Customer Option Register 0 (Read/Write)

Bit Number	Bit Mnemonic	Description
6	XTLHF	External clock source frequency mode register selection bit 0: Match with the external clock source which frequency <12M 1: Match with the external clock source which frequency ≥12M

The SC92F836XB has a special function: the user can modify SFR value to adjust frequency of HRC within certain scope. User can realize this operation by configuring OP_HRCR register. For configuration method of this register, refer to [5.2.1 Customer-Option-related Registers Operation Instructions](#).

OP_HRCR (83h@FFH) System Clock Change Register (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	OP_HRCR[7: 0]							
R/W	R/W							
POR	n	n	n	n	n	n	n	n

Bit Number	Bit Mnemonic	Description
7 ~ 0	OP_HRCR[7: 0]	HRC frequency change register User can change high-frequency oscillator frequency f_{HRC} by modifying the value of this register, and then change the IC system clock frequency f_{SYS} : 1. Initial value OP_HRCR[s] after OP_HRCR[7: 0] power-on is a fixed value, which guarantee f_{HRC} is 24MHz, there may be difference in OP_HRCR[s] of each IC

2. When initial value is OP_HRCR[s], IC system clock frequency f_{SYS} can set specifically as 12/6/2MHz by Option. For each change of 1 for OP_HRCR [7: 0], the change of f_{SYS} frequency is about 0.23%.

The relationship between OP_HRCR [7: 0] and output frequency f_{SYS} is shown as follows:

OP_HRCR [7:0]	f_{SYS} actual output frequency (taking 12M as an example)
OP_HRCR [s]-n	$12000 * (1 - 0.23\% * n)$ kHz
...
OP_HRCR [s]-2	$12000 * (1 - 0.23\% * 2) = 11944.8$ kHz
OP_HRCR [s]-1	$12000 * (1 - 0.23\% * 1) = 11972.4$ kHz
OP_HRCR [s]	12000 kHz
OP_HRCR [s]+1	$12000 * (1 + 0.23\% * 1) = 12027.6$ kHz
OP_HRCR [s]+2	$12000 * (1 + 0.23\% * 2) = 12055.2$ kHz
...	...
OP_HRCR [s]+n	$12000 * (1 + 0.23\% * n)$ kHz

Notes:

- 1. The value of OP_HRCR[7:0] after each power-on of the IC is the value of high-frequency oscillator frequency f_{HRC} closest to 24MHz; the user can modify the value of HRC after each power-on by means of EEPROM to make IC system clock frequency f_{SYS} work at the frequency the user needs.**
- 2. To guarantee IC operating reliably, the maximum operating frequency of IC shall not exceed 10% of 12MHz, which is 13.2MHz;**
- 3. The user shall confirm the change of HRC frequency will not influence other functions.**

7.5 Low-speed RC Oscillator

The SC92F836XB is equipped with a built-in 128kHz RC oscillation circuit, which can be set as clock source of low-frequency clock timer Base Timer and WDT.

Base Timer, a low-frequency clock timer which can wake up CPU from STOP mode and generate interrupt.

BTMCON (CEH) Low-Frequency Timer Control Register (Read/Write)

POR	0	0	x	x	0	0	0	0

Bit Number	Bit Mnemonic	Description
7	ENBTM	Low-frequency Base Timer start control bit 0: Base Timer not start 1: Base Timer start
6	BTMIF	Base Timer interrupt application flag bit When CPU receives Base Timer interrupt, this flag will be cleared automatically by hardware.
3 ~ 0	BTMFS [3: 0]	Low-frequency clock interrupt frequency selection bits 0000: an interrupt is generated for every 15.625ms 0001: an interrupt is generated for every 31.25ms 0010: an interrupt is generated for every 62.5ms 0011: an interrupt is generated for every 125ms 0100: an interrupt is generated for every 0.25s 0101: an interrupt is generated for every 0.5s 0110: an interrupt is generated for every 1.0s

		0111: an interrupt is generated for every 2.0s 1000: an interrupt is generated for every 4.0s 1001 ~ 1111: reserved
5 ~ 4	-	Reserved

7.6 Power Saving Modes

The SC92F836XB provides a SFR PCON, the user can configure bit 0 and bit 1 of this register to control MCU to enter different operating modes.

When PCON.1 = 1, internal high-frequency system clock would stop and system enter STOP mode, to save power. The system can be woken up from STOP by external interrupt INT0 ~ INT2, low-frequency clock interrupt, TK interrupt, and external reset input.

When PCON.0 = 1, the program would stop running and System enter IDLE mode. But the external equipment and clock will continue running, CPU will keep all states before entering IDLE mode. The system can be woken up from IDLE by any interrupt.

PCON (87H) Power Management Control Register (only for write, *unreadable*)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	SMOD	-	-	-	-	-	STOP	IDL
R/W	W	-	-	-	-	-	W	W
POR	0	x	x	x	x	x	0	0

Bit Number	Bit Mnemonic	Description
1	STOP	STOP mode control bit 0: normal operating mode 1: stop mode, high-frequency oscillator stops operating, low-frequency oscillator and WDT can select to work based on configuration
0	IDL	IDLE mode control bit

		0: normal operating mode 1: IDLE mode, the program stops operating, but external equipment and clock continue to operate and all CPU states are saved before entering IDLE mode
--	--	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Notes: When Configure MCU to enter STOP or IDLE mode, the instruction of configuring PCON register should be followed by 8 “NOP” instructions rather than other instructions. Or else, it will be unable to execute following instructions normally after wake-up!

For example, configure MCU to enter STOP mode:

C program example:

```
#include"intrins.h"

PCON |= 0x02;      //Set to 1 for PCON bit1 STOP bit, configure MCU to enter STOP mode

_nop_ ();         //At least 8 _nop_ () required

_nop_ ();
_nop_ ();
_nop_ ();
_nop_ ();
_nop_ ();
_nop_ ();
_nop_ ();
_nop_ ();
.....
```

Assembly program example:

```
ORL PCON, #02H    ; Set to 1 for PCON bits1 STOP bit, configure MCU to enter STOP mode

NOP               ; At least 8 NOP required

NOP
NOP
NOP
NOP
NOP
NOP
NOP
NOP
NOP
.....
```

8 CPU and Function System

8.1 CPU

CPU used by the SC92F836XB is the high-speed 1T standard 8051 core, whose instructions are completely compatible with traditional 8051 core microcontroller unit.

8.2 Addressing Mode

The addressing mode of the SC92F836XB 1T 8051 CPU instructions includes: ① Immediate Addressing ② Direct Addressing ③ Indirect Addressing ④ Register Addressing ⑤ Relative Addressing ⑥ Indexed Addressing ⑦ Bit Addressing

8.2.1 Immediate Addressing

Immediate addressing is also called immediate operand addressing, which is the operand given to participate in operation in instruction, the instruction is illustrated as follows:

MOV A, #50H (This instruction is to move immediate operand 50H to Accumulator A)

8.2.2 Direct Addressing

In direct addressing mode, the instruction operand field indicates the address to participate in operation operand. Direct addressing can only be used to address SFRs, internal data registers and bit address space. The SFRs and bit address space can only be accessed by direct addressing. For example:

ANL 50H, #91H (The instruction indicates the data in 50H unit AND immediate operand 91H, and the results are stored in 50H unit. 50H refers to direct address, indicating one unit in internal data register RAM.)

8.2.3 Indirect Addressing

Indirect addressing is expressed as adding "@" before R0 or R1. Suppose the data in R1 is 40H and the data of internal data register 40H unit is 55H, then the instruction will be

MOV A, @R1 (Move the data 55h to Accumulator A).

8.2.4 Register Addressing

Register addressing is to operate the data in the selected registers R7 ~ R0, Accumulator A, general-purpose register B, address registers and carry bit C. The registers R7-R0 is indicated by lower 3 bits of instruction code. ACC, B, DPTR and carry bit C are implied in the instruction code. Therefore, register addressing can also include an implied addressing mode. The selection of register operating area depends on RS1 and RS0 of PSW. The registers indicated by instruction operand refers to the registers in current operating area.

INC R0 refers to (R0) +1 → R0

8.2.5 Relative Addressing

Relative addressing is to add current value in program counter (PC) and the data in the second byte of the

instruction, whose result shall be taken as the jump address of jump instruction. The Jump address is the target jump address, the current value in PC is the base address and the data in the second byte of the instruction is the offset address. Because the target jump address is relative to base address in PC, such addressing mode is called relative addressing. The offset is signed number, which ranges from +127 to -128, such addressing mode is mainly applied to jump instruction.

```
JC    $ +50H
```

It indicates that if the carry bit C is 0, the contents in program counter PC remain the same, meaning no jump. On the contrary, if the carry bit C is 1, take the sum of the current value in PC and base address as well as offset 50H as the target jump address of this jump instruction.

8.2.6 Indexed Addressing

In indexed addressing mode, the instruction operand is to develop an indexed register to store indexed base address. Upon indexed addressing, the result by adding offset and indexed base address is taken as the address of operation operand. The indexed registers include PC and address register DPTR.

```
MOVC  A, @A+DPTR
```

It indicates Accumulator A is used as offset register. Take the sum of the value in A and that in the address register DPTR as the address of operand. Then take the figure in the address out and transmit it to Accumulator A.

8.2.7 Bits Addressing

Bit addressing is a kind of addressing mode when conducting bit operation on internal data storage RAM and SFRs which are able to carry out bit operations. Upon bit operations, by taking carry bit C as bit operation accumulator, the instruction operand will give the address of this bit directly, then execute bit operation based on the nature of operation code.

```
MOV  C, 20H (Transmit the bit operation register with address of 20H into carry bit C)
```

9 Interrupt

The SC92F836XB provides 12 interrupt sources: Timer0, Timer1, Timer2, INT0 ~ 2, ADC, PWM, UART, SSI, Base Timer and TK. These 12 interrupt sources are equipped with 2-level interrupt priority capability and each interrupt source can be individually configured in high priority or low priority. As for three external interrupts, the triggering condition of each interrupt source can be set as rising edge, falling edge or dual-edge trigger. Each interrupt is equipped with independent priority setting bit, interrupt flag, interrupt vector and enable bit. Global interrupt enable bit EA can enable or disable all interrupts.

9.1 Interrupt Source and Vector

Lists for the SC92F836XB interrupt source, interrupt vector and related control bit are shown below:

Interrupt Source	Interrupt condition	Interrupt Flag	Interrupt Enable Control	Interrupt Priority Control	Interrupt Vector	Query Priority	Interrupt Number (C51)	Flag Clear Mode	Capability of Waking up STOP
INT0	Compliant with External interrupt 0 conditions	IE0	EINT0	IPINT0	0003H	1 (high)	0	H/W Auto	Yes
Timer0	Timer0 overflow	TF0	ET0	IPT0	000BH	2	1	H/W Auto	No
INT1	Compliant with External interrupt 1 conditions	IE1	EINT1	IPINT1	0013H	3	2	H/W Auto	Yes
Timer1	Timer1 overflow	TF1	ET1	IPT1	001BH	4	3	H/W Auto	No
UART	Receiving or transmitting completed	RI/TI	EUART	IPUART	0023H	5	4	Must be cleared by user	No
Timer2	Timer2 overflow	TF2	ET2	IPT2	002BH	6	5	Must be cleared by user	No
ADC	ADC conversion completed	ADCIF	EADC	IPADC	0033H	7	6	Must be cleared by user	No
SSI	Receiving or transmitting completed	SPIF/TWIF	ESSI	IPSPI	003BH	8	7	Must be cleared by user	No
PWM	PWM overflow	PWMIF	EPWM	IPPWM	0043H	9	8	H/W Auto	No
BTM	Base timer overflow	BTMIF	EBTM	IPBTM	004BH	10	9	H/W Auto	Yes

INT2	External interrupt 2 conditions compliant	-	EINT2	IPINT2	0053H	11	10	-	Yes
TK	TouchKey counter overflow	TKIF	ETK	IPTK	005B	12	11	H/W Auto	No

Under the circumstance where the master interrupt control bit EA and the respective interrupt control bit have been enable, the interrupt occurrence is shown below:

Timer Interrupt: Interrupt generates when Timer0 or Timer1 overflows and the interrupt flag TF0 or TF1 is set to “1”. When the microcontroller unit responds to the timer interrupt, the interrupt flag TF0 or TF1 is reset automatically by hardware. Interrupt generates when Timer2 overflows and the interrupt flag TF2 is set to “1”. Once Timer2 interrupt generates, the hardware would not automatically clear TF2 bit, which must be cleared by the user’s software.

ADC Interrupt: After ADC conversion is completed, ADC interrupt generates, whose interrupt flag is the ADC conversion completion flag EOC/ADCIF (ADCCON.5). When user starts ADCS conversion, EOC will be reset automatically by hardware. Once conversion completes, EOC would be set to “1” automatically by hardware. User should clear the ADC interrupt flag by software when the interrupt service routine is executed after ADC interrupt generates.

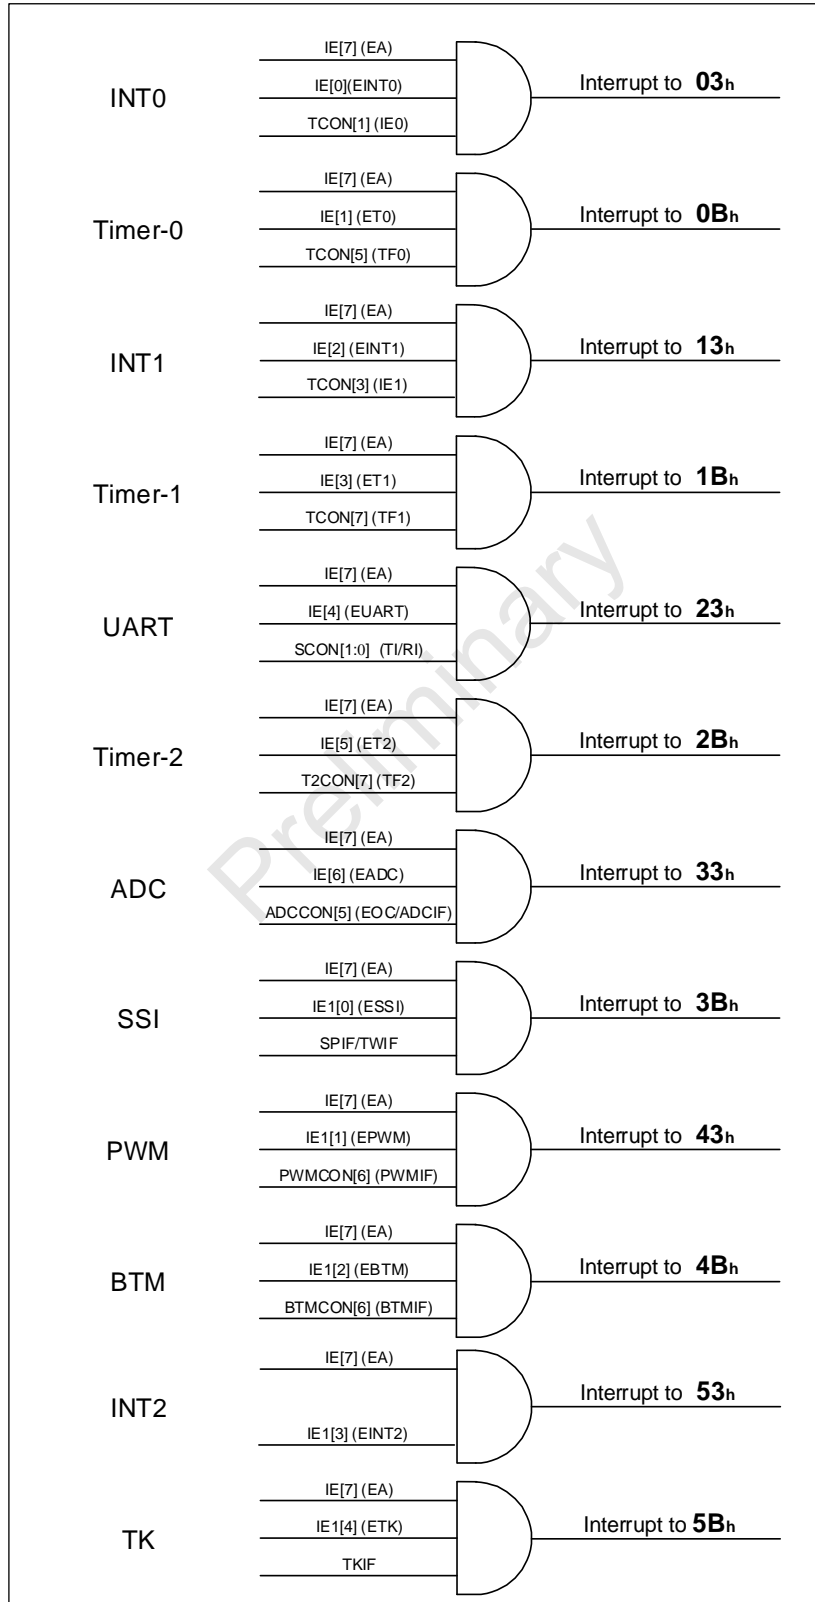

SSI Interrupt: When SSI completes receiving or transmitting a frame of data, SPIF/TWIF bit will be set to “1” automatically by hardware, and SSI interrupt generates. When the microcontroller unit serves SSI interrupt, the interrupt flag SPIF/TWIF must be cleared by software.

PWM Interrupt: When PWM counter overflows (beyond PWMPD), The PWMIF bit will be set to 1 automatically by hardware, PWM interrupt generates. When the microcontroller unit executes PWM interrupt, the interrupt sign PWMIF will be clear to “0” automatically by hardware.

External Interrupt INT0 ~ 2: When any external interrupt pin meets the interrupt conditions, external interrupt generates. There are 3 external interrupt sources for INT0, 4 external interrupt sources for INT1 and 6 external interrupt sources for INT2, which can be set in rising edge, falling edge or dual edge interrupt trigger mode by setting SFRs (INTxF and INTxR). User can set the priority level of each interrupt through IP register. Besides, external interrupt INT0 ~ 2 can also wake up STOP mode of microcontroller unit.

9.2 Interrupt Structure Diagram

The SC92F836XB interrupt structure is shown in the figure below:

The SC92F836XB Interrupt Structure and Vector

9.3 Interrupt Priority

The SC92F836XB microcontroller unit has two-level interrupt priority capability. The interrupt requests of these interrupt sources can be programmed as high-priority interrupt or low-priority interrupt, which is to realize the nesting of two levels of interrupt service programs. One interrupt can be interrupted by a higher priority interrupt request when being responded to, which can not be interrupted by another interrupt request at the same priority level, until such response to the first-come interrupt ends up with the instruction “RETI”. Exist the interrupt service routine and return to main program, the system would execute one more instruction before responding to new interrupt request.

That is to say:

- ① A lower priority interrupt can be interrupted by a higher priority interrupt request, but not vice versa;
- ② Any kind of interrupt being responded to can not be interrupted by another interrupt request at the same priority level.

Interrupt query sequence: As for the sequence of that the SC92F836XB microcontroller unit responds to the same priority interrupts which occur in the meantime, the priority sequence of interrupt response shall be the same as the interrupt query number in C51, which is to preferentially respond to the interrupt with smaller query number then the interrupt with bigger query number.

9.4 Interrupt Processing Flow

When any interrupt generates and is responded by CPU, the operation of main program will be interrupted to carry out the following operations:

- ① Complete execution of instruction being currently executed;
- ② Push the PC value into stack for site protection;
- ③ Load Interrupt vector address into program counter (PC);
- ④ Carry out corresponding interrupt service program;
- ⑤ End Interrupt service program ends and execute RETI;
- ⑥ Pop PC value from stack and return to the program before responding to the interrupt.

During this process, the system will not immediately respond to other interrupts at the same priority level, but it will keep all interrupt requests having occurred and respond to new interrupt requests upon completing handling of the current interrupt.

9.5 Interrupt-related Registers

IE (A8H) Interrupt Enable Register (Read/Write)

10 Timer/Counter T0 and T1

The SC92F836XB has two 16-bit Timer/Counters, Timer0 (T0) and Time1 (T1), with two operating modes: counter mode and timer mode. The operating modes selected by bit C/Tx in the SFR TMOD. T0 and T1 are essentially adding counters with different counting source. The source of timer generated from system clock or frequency division clock, but the source of counters is the input pulse to external pin. Only when TRx = 1, will T0 and T1 be enabled on for counting.

In counter mode, each input pulse on P1.2/T0 and P1.3/T1 pin will make the count value of T0 and T1 increase by 1 respectively.

In timer mode, users can select $f_{sys}/12$ or f_{sys} (f_{sys} is the system clock after frequency division) as counting source of T0 and T1 by configuring SFR TMCON.

Timer/Counter T0 has 4 operating modes, and Timer/Counter T1 has 3 operating modes (Mode 3 does not exist):

- ① Mode 0: 13-bit Timer/Counter mode
- ② Mode 1: 16-bit Timer/Counter mode
- ③ Mode 2: 8-bit automatic reload mode
- ④ Mode 3: Two 8-bit timers/counters mode

In above modes, modes 0, 1 and 2 of T0 and T1 are the same, and mode 3 is different.

10.2 T0 Operating Modes

Timer0 can be configured in one of four operating modes by setting the bit pairs (M10, M00) in the TMOD register.

Operating mode 0: 13-bit Timer/Counter

TH0 register is to store the high 8 bits (TH0.7 ~ TH0.0) of 13-bit Timer/Counter and TL0 is to store the low 5 bits (TL0.4 ~ TL0.0). The high three bits of TL0 (TL0.7 ~ TL0.5) are filled with uncertain values, they shall be omitted upon reading. When 13-bit Timer/Counter overflows with count increment, the system will set timer overflow flag TF0 to 1. An interrupt will be generated if the timer0 interrupt is enabled.

C/T0 bit selects the clock input source of Timer/Counter. If C/T0=1, the level fluctuation from high to low of Counter 0 input pin T0 (P1.2) will make Counter 0 data register add 1. If C/T0=0, the frequency division of system clock is the clock source of Timer0.

When TR0 = 1, Timer 0 is enabled. Setting TR0 would not reset the timer forcibly. It means that the timer register will start to count from the value of last clearing of TR0. Therefore, before enable the timer, it is required to configure the initial value of timer register.

When configured as a timer, the SFR T0FD is used to select fractional frequency ratio of clock source.

Operating mode 0: 13-bit Timer/Counter

Operating Mode 1: 16 Counter/Timer

Except for using 16 bits of (valid for all 8 bits of TL0) Timer/Counter, in mode 1 and mode 0, the operating mode, opening and configuration method are the same.

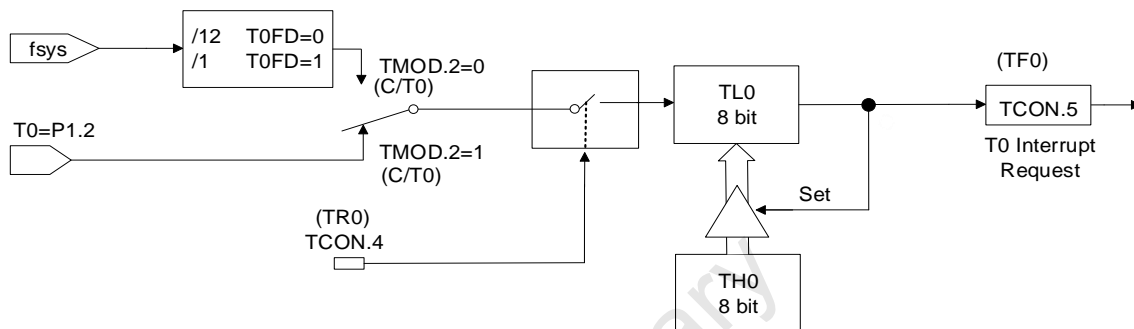

Operating mode 1: 16-bit Timer/Counter

Operating Mode 2: 8 Automatic Reload Counter/Timer

In operating mode 2, Timer0 is 8-bit automatic reload Timer/Counter. TL0 is to store counting value and TH0 is to store the reload value. When the counter in TL0 overflows and turn to 0x00, the overflow flag of Timer TF0 will be set to 1, and the data in register TH0 will be reloaded into register TL0. If the timer interrupt enabled, setting TF0 to 1 will generate an interrupt, but the reloaded value in TH0 will remain the same. Before starting the Timer to count correctly, TL0 shall be initialized to the required value.

Except for automatic reloaded function, the enabling and configuration mode of Timer/Counter in operating mode 2 shall be the same as that in mode 0 and mode 1.

When configured as a timer, the SFR TMCON bit 0 (T0FD) is used to select fractional frequency ratio of system clock f_{sys} .

Operating Mode 2: 8 Automatic Reload Counter/Timer

Operating Mode 3: Two 8-bit Counter/Timer (only for Timer0)

In operating mode 3, Timer0 is used as two independent 8-bit Timer/Counters, respectively controlled by TL0 and TH0. TL0 is controlled by control bit (in TCON) and status bit (in TMOD) of Timer0 (TR0), C/T0, TF0. Timer0 is selected as Timer or Counter by TMOD bit 2 (C/T0).

TH0 is only limited to in Timer Mode, which is unable to configure as a Counter by TMOD.2 (C/T0). TH0 is enabled by set the timer control bit TR1 to 1. When overflow occurs and interrupt is discovered, set TF1 to 1 and proceed the interrupt as T1 interrupt.

When T0 is configured in Operating Mode 3, TH0 Timer occupies T1 interrupt resources and TCON register and the 16-bit counter of T1 will stop counting, equivalently "TR1=0". When adopting TH0 timer, it is required to configure TR1=1.

10.3 T1 Operating Modes

Timer1 can be configured in one of three operating modes by setting the bit pairs (M11, M01) in the TMOD register.

Operating mode 0: 13-bit Timer/Counter

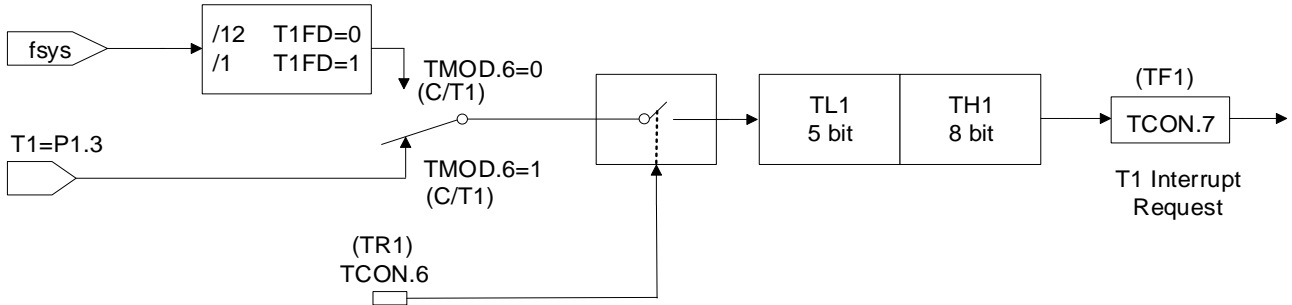

TH1 register is to store high 8-bit (TH1.7 ~ TH1.0) of 13-bit Timer/Counter and TL1 is to store low 5-bit (TL1.4 ~ TL1.0). The high 3-bit of TL1 (TL1.7 ~ TL1.5) are uncertain values, they shall be omitted upon reading. When 13-bit Timer/Counter overflow with count increment, the system will set timer overflow flag TF1 as 1. An interrupt will be generated if the timer1 interrupt is enabled. C/T1 bit selects the clock input source of Timer/Counter.

If C/T1=1, the level fluctuation from high to low of timer1 input pin T1 (P1.3) will make timer1 data register add 1. If C/T1=0, the frequency division of system clock is the clock source of timer1.

When TR1 is set to 1 and the timer is enabled. Setting TR1 does not force to reset timer counters, it means, if set

TR1 to 1, the timer register will start to count from the value of last clearing of TR1. Therefore, before allowing timer, it is required to configure the initial value of timer register.

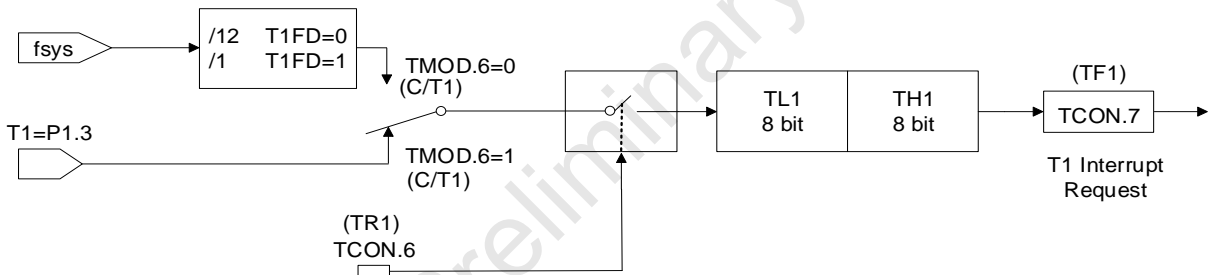

When configured as timer, the SFR T1FD is used to select fractional frequency ratio of clock source.

Operating mode 0: 13-bit Timer/Counter

Operating Mode 1: 16 Counter/Timer

Except for using 16-bit (valid for 8-bit data of TL1) Timer/Counter, the operating mode of mode 1 and mode 0 is the same. And the opening and configuration mode of both are also the same.

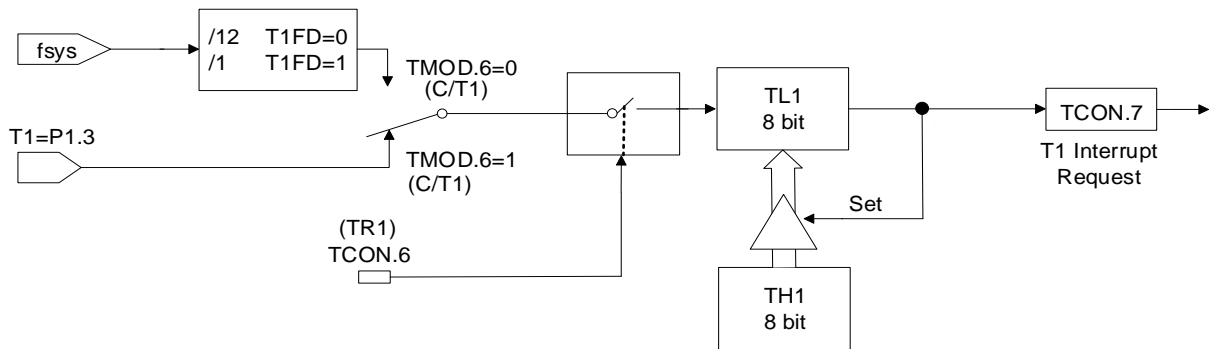

Operating mode 1: 16-bit Timer/Counter

Operating Mode 2: 8 Automatic Reload Counter/Timer

In operating mode 2, Timer1 is 8-bit automatic reload Timer/Counter. TL1 is to store counting value and TH1 is to store the reload value. When the counter in TL1 overflows 0x00, the overflow flag of Timer TF1 will be set to 1, and the value of register TH1 will be reloaded into register TL1. If enable the timer interrupt, setting TF1 to 1 will generate an interrupt, but the reloaded value in TH1 will remain unchanged. Before allowing Timer to correctly count, TL1 shall be initialized to the required value.

Except for automatic reloaded function, the enabling and configuration mode of Timer/Counter in operating mode 2 shall be the same as that of mode 0 and mode 1.

When configured as timer, the SFR TMCON bit 4 (T1FD) is used to select the ratio of clock source of timer to fractional frequency of system clock f_{sys} .

Operating Mode 2: 8 Automatic Reload Counter/Timer

11 Timer/Counter T2

Timer2 inside the SC92F836XB microcontroller unit has two operating modes, namely counter mode and timer mode. There is a control bit C/T2 in SFR T2CON to select Timer or Counter for T2. They are adding counters in nature, differing in counting source. The clock source of T2 comes from system clock or frequency division clock, but the source of counters is the input pulse to external pin. TR2 is the counting switch of Timer/Counter T2. Only when TR2 = 1, will T2 be enabled for counting.

In counter mode, each input pulse on T2 pin will make the counting value of T2 increase by 1.

In timer mode, users can select $f_{sys}/12$ or f_{sys} as counting source of T2 by configuring SFR TMCON.

Timer/Counter T2 has 4 operating modes:

- ① Mode 0: 16-bit capture mode
- ② Mode 1: 16-bit automatic reload timer mode
- ③ Mode 2: Baud rate generator mode
- ④ Mode 3: Programmable clock output mode

Bit Number	Bit Mnemonic	Description
5	IPT2	Timer2 interrupt priority selection bit 0: Configure Timer2 interrupt priority as "low" 1: Configure Timer2 interrupt priority as "high"

value of DCEN bit is 0 and Timer2 is defaulted as decreasing counting. When setting DCEN to 1, the incrementing or decreasing counting depends on the level of T2EX pin.

When DCEN = 0, There are two options for EXEN2 bit in T2CON:

1. EXEN=0, Timer2 will increase to 0xFFFFH and set TF2 bit after overflow. Meanwhile, the timer will load 16-bit value in registers RCAP2H and RCAP2L written by user software into registers TH2 and TL2 automatically.
2. EXEN2=1, both the overflow and the falling edge signal on external input T2EX can trigger a 16-bit count value reloading and set EXF2 bit. If T2 interrupt is enabled (ET2=1), both TF2 and EXF2 bit can generate an interrupt.

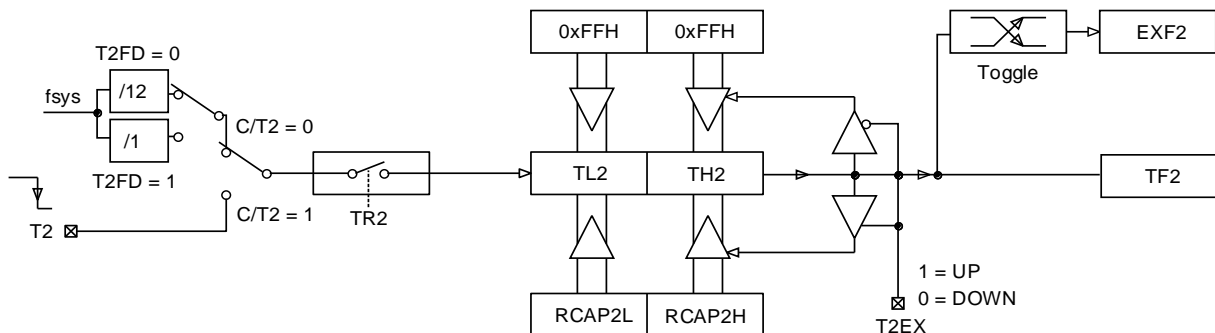

Operating Mode 1: 16-bit Automatic Reload Timer DCEN = 0

Configure CEN bit to allow Timer2 for incremental or decreasing counting. When DCEN=1, T2EX pin controls the count direction, and the control of EXEN2 becomes invalid.

Setting T2EX to 1 can conduct incremental count on Timer2. The Timer overflows when it increases to 0xFFFFH, then it sets TF2 bit. Besides, the overflow can also respectively cause 16-bit value in RCAP2H and RCAP2L to be reloaded into timer registers.

Setting T2EX to 0 can conduct decreasing count on Timer2. When the value in TH2 and TL2 is equal to that of RCAP2H and RCAP2L, the timer overflows. TF2 bit will be set up and 0xFFFFH reloaded into timer register.

No matter whether timer2 overflows or not, bit EXF2 will be used as the 17th bit of the results. Under such operating mode, EXF2 is no longer taken as interrupt flag.

Operating Mode 1: 16-bit Automatic Reload Timer DCEN = 1

Operating Mode 2: Baud Rate Generator

Configure TCLK and RCLK in T2CON register to select Timer2 as baud rate generator. The baud rate of receiver and transmitter can be different. If Timer2 is taken as either one between receiver and transmitter, Timer1 will be taken as another.

Configure TCLK and RCLK in T2CON register to make Timer2 in baud rate generator mode. Such mode is similar to automatic reload mode

Overflow of Timer2 can make the value in registers RCAP2H and RCAP2L reloaded into the Timer2 and counting, but no interrupt will occur.

If EXEN2 is set to 1, the falling edge on T2EX pin will be set up EXF2 without a reloading. Therefore, when Timer2 is taken as baud rate generator, T2EX can be taken as an additional external interrupt

The baud rate of UART mode 1 and mode 3 depends on overflow rate of Timer2 and the following formula:

$$\text{BaudRate} = \frac{f_{\text{sys}}}{[\text{RCAP2H}, \text{RCAP2L}]} ; (\text{note: } [\text{RCAP2H}, \text{RCAP2L}] \text{ must be larger than } 0x0010)$$

The schematic diagram of Timer2 as baud rate generator is shown as follows:

Mode 2: Baud Rate Generator

Operating Mode 3: Programmable Clock Output

In this mode, T2 can be programmed to output a 50% duty cycle clock: when $C/\overline{T2} = 0$ and $T2OE = 1$, Timer2 is taken as clock generator

In this mode, duty cycle of T2 output clock is 50%

$$\text{Colck Out Frequency} = \frac{fn2}{(65536 - [\text{RCAP2H}, \text{RCAP2L}]) \times 4} ;$$

Including, $fn2$ is the clock frequency of Timer2

$$fn2 = \frac{f_{\text{sys}}}{12}; \quad T2FD = 0$$

$$fn2 = f_{\text{sys}}; \quad T2FD = 1$$

Overflow of Timer2 does not generate an interrupt, T2 pin is taken as clock output.

Operating Mode 3: Programmable Clock Output

Note:

1. Both TF2 and EXF2 can generate interrupt request of Timer2, both of which has the same interrupt vector;
2. TF2 and EXF2 can be set by software, only software and hardware reset can clear TF2 and EXF2;
3. When EA = 1 and ET2 = 1, setting up TF2 or EXF2 to 1 can arouse interrupt of Timer2;
4. When Timer2 is taken as baud rate generator, the value written in TH2/TL2 or RCAP2H/RCAP2L may influence the accuracy of baud rate and thus result in error of communication.

12 Multiplier-Divider Unit (MDU)

The SC92F836XB provides a 16-bit multiplier-divider, which is composed of extended accumulator EXA0 ~ EXA3, extended B register EXB and operation control register OPERCON. It can replace the software 16-bit*16-bit multiply operation and 32-bit /16-bit division operation.

Mnemonic	Add	Description	7	6	5	4	3	2	1	0	POR
EXA0	E9H	Extended Accumulator 0	EXA [7: 0]								0000000b

Note:

1. During the operation process, it is forbidden to read or write EXA and EXB data registers.
2. The time for operation conversion of multiplier is $16/f_{\text{SYS}}$.

13 PWM

The SC92F836XB provides an independent counter, which is able to support 6-channel PWM output: PWM0 ~ 5.

The SC92F836XB PWM has the following functions:

- ① 10-bit precision;
- ② Output can be configured in forward or reverse direction;
- ③ Independent mode and complementary mode:
 - 1) In independent mode, PWM0 ~ 5 shared the same clock cycle, but the duty cycle of each PWM channel can be configured separately;
 - 2) In complementary mode, three pairs of complementary PWM waveform with dead zone can be output simultaneously;
- ④ Provide one PWM overflow interrupt.

The cycle and duty cycle of the SC92F836XB PWM is adjustable. Registers PWMCFG, PWMCON controll PWM status and cycle as well as opening of each channel of PWM and duty cycle of output waveform can be adjusted separately.

13.3 PWM General Configuration Registers

The SC92F836XB PWM working mode is divided into independent mode and complementary mode. The registers shared by these two modes are as follows:

The user can select PWM clock source from 4 options by configuring PWMCFG[7: 6]. INV0 ~ 5 is used to select if PWM0 ~ 5 output is in reverse direction. PWMPRD [9: 0] is the six-channel PWM shared period configuration controller. When PWM counter counts to the preset value of PWMPRD[9: 0], this counter will skip to 00_h when next PWM CLK comes. That is to say, PWM0-5 period is (PWMPRD [9: 0] + 1) *PWM clock. Users can set PWM0 ~ 5 shared period by configuring PWMPRD [7: 0] and PWMDTYA [7: 6].

Note: To guarantee the data is written correctly, writing operation to PWM period register must follow the sequence of first low 2 bits followed by high 8 bits.

IE1 (A9H) Interrupt Enable Register (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	-	-	-	ETK	EINT2	EBTM	EPWM	ESSI

POR	0	x	0	0	0	0	0	0

Bit Number	Bit Mnemonic	Description
7	PWMMOD	<p>PWM Mode Configuration Bit</p> <p>0: Independent Mode: PWM0 ~ 5 duty configuration</p> <p>1: Complementary Mode: PWM0/3, PWM1/4, PWM2/5. The output pulse width of the same group of PWM is the same, which is separately controlled by PDT0 ~ 2[9: 0] and dead zone is configured by register PDT3.</p> <p>Note: When ENPWM = 1, PWM module is enabled. When ENPWMn = 0, PWM output is closed and used as GPIO. At this time, PWM module can be used as a 10-bit Timer, and PWM will still generate interrupt if EPWM (IE1.1) is set to 1.</p>

13.4 PWM Independent Mode

In independent mode (PWMMOD = 0), PWMDTY0 ~ 5, PWMDTYA and PWMDTYB can be used as duty cycle configuration registers of PWM0 ~ 5. The user shall configure PWM output status and period and corresponding duty cycle registers of PWM channel to output PWM waveform with fixed duty cycle output.

13.4.1 PWM Independent Mode Diagram

The SC92F836XB PWM Independent Mode Block Diagram

13.4.2 PWM Independent Mode Duty cycle Configuration

To guarantee write data correctly, writing operation to PWM duty cycle registers must follow the sequence of first low 2-bit followed by high-byte.

5 ~ 0	PDTx [1: 0] (x=0 ~ 5)	PWMx duty cycle length configuration of low 2 bits; High level width of PWMx is (PDTx[9: 0]) PWM clocks.

13.5 PWM Complementary Mode

When the SC92F836XB PWM works in complementary mode, the dead-time control module can prevent the overlap of valid time zones between two complementary output channel PWM signals, so as to guarantee that a pair of complementary power switches tube driven by PWM signals will not work at the same time in practical applications.

In complementary mode (PWMMOD = 1), PWM0 and PWM3 become one group and the duty cycle is to be adjusted by PDT0[9: 0]; PWM1 and PWM4 become one group and the duty cycle is to be adjusted by PDT1[9: 0]; PWM2 and PWM5 become one group and the duty cycle is to be adjusted by PDT2[9: 0].

In complementary mode, the registers PWMDTY4 ~ 5 is invalid, the register PWMDTY3 bit is redefined as PWM3/4/5 falling edge dead zone time control bit PDF[3: 0] and PWM0/1/2 rising edge dead zone time control bit PDR[3: 0].

13.5.1 PWM Complementary Mode Diagram

13.5.4 PWM Dead-time Output Waveform

Below is the waveform diagram for PWM0 and PWM3 adjusted by dead zone under complementary mode, To be better distinguish able, PWM3 is in reverse direction (INV3=1).

Waveform of PWM Output with Dead Zone

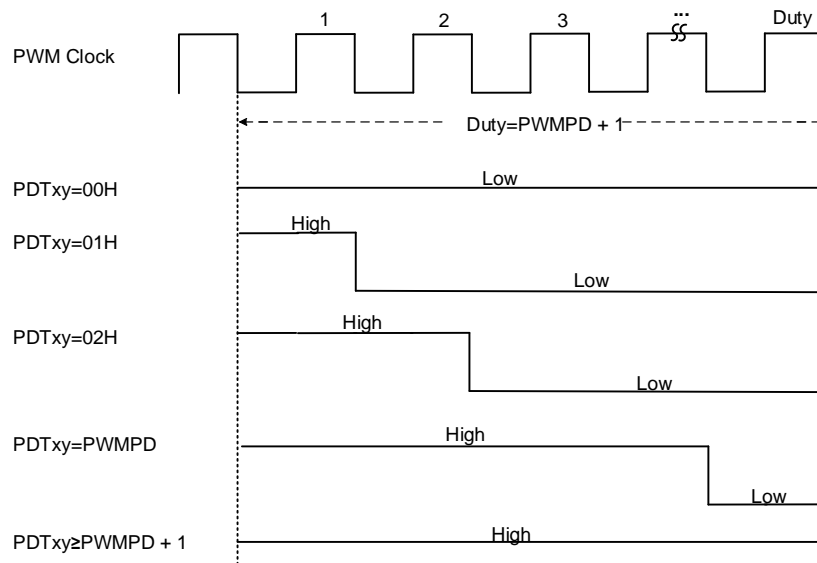

Diagram for Relationship between Period and Duty cycle

The relationship between period and duty cycle is shown in the figure above. The precondition of this result is the PWMn output reverse control (INVn) is initialized to 0; if it is required to get the contrary result, set INVn to 1.

Preliminary

14 General-purpose I/O (GPIO)

The SC92F836XB offers up to 26 bidirectional controllable GPIOs, input and output control registers are used to control the input and output state of various ports, when the port is used as input, each I/O port is equipped with internal pull-up resistor controlled by PxPHY. Such 26 IOs are shared with other functions, including P0.0 ~ P0.4 can be used as LCD COM driver by configuring output voltage as $1/2 V_{DD}$. Under input or output state, what I/O port read from the value of port data register is the actual state value of the port.

Note: Unused IO port or IO port with no package pin shall be configured as strong push-pull output mode.

14.1 GPIO Structure Diagram

Strong Push-pull Output Mode

In strong push-pull output mode, it is able to provide continuous high current drive: high output for the current larger than 20mA and low output for the current larger than 70mA

The port structure diagram for strong push-pull output mode is shown below:

Strong Push-pull Output Mode

Pull-up Input Mode

In pull-up input mode, a pull-up resistor is connected on the input port, only when the level on the input port is pulled down, low level signal can be detected.

The port structure diagram for pull-up input mode is shown below:

Pull-up Input Mode

High Impedance Input Mode. (Input only)

The port structure diagram for input only mode is shown below:

16 Serial Interface 0 (UART0)

The SC92F836XB supports a full-duplex serial port. It is convenient for connecting other device or equipment, for example, WiFi module or other drive chips with UART communication interface. UART0 functions and features are shown below:

1. Three kinds of communication mode: Mode 0, Mode 1 and Mode 3;
2. Configure Timer1 or Timer2 as baud rate generator;
3. Completion of transmission and reception can generate interrupt RI/TI, and such interrupt flag needs to be cleared up by software.

SCON (98H) Serial Port Control Register (Read/Write)

Bit Number	Bit Mnemonic	Description
7 ~ 0	SBUF[7: 0]	Serial Port Data Cache Register SBUF contains two registers: one for transmitting shift register and one for receiving latch; data written into SBUF will be transmitted to shift register and initiate transmitting process; reading SBUF will return the contents of receiving latch.

PCON (87H) Power Management Control Register (only readable, * unreadable*)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	SMOD	-	-	-	-	-	STOP	IDL
R/W	W	-	-	-	-	-	W	W
POR	0	x	x	x	x	x	0	0

Bit Number	Bit Mnemonic	Description
7	SMOD	Baud rate multiplying power configuration bit, only valid for mode 0 (SM0 ~ 1 = 00): 0: Serial port operates under clock of 1/12 system clock 1: Serial port operates under clock of 1/4 system clock

16.1 Baud Rate of Serial Communication

In mode 0, baud rate can be programmed as 1/12 or 1/4 of system clock and determined by SMOD (PCON.7) bit. When SMOD is set to 0, the serial port operates in 1/12 of system clock. When SMOD is set to 1, serial port operates in 1/4 of system clock.

In mode 1 and mode 3, the user can select overflow rate of Timer1 or Timer2 as baud rate by configuration.

Set TCLK (T2CON.4) and RCLK (T2CON.5) bit to configure Timer2 as TX and RX clock source of baud rate (Refer to the timer section for details). No matter TCLK or RCLK is set to logic 1, Timer2 can be in the mode of baud rate generator. If TCLK and RCLK are set to logic 0, Timer1 can be baud clock source of Tx and Rx.

Mode 1 and Mode 3 baud rate formula is shown below, including that [TH1、TL1] are the 16-bit counter registers of Timer1, and [RCAP2H、RCAP2L] are the 16-bit reload registers of Timer2.

1. When Timer1 is used as baud rate generator, it must stop counting, meaning TR1=0:

$$\text{BaudRate} = \frac{f_{\text{sys}}}{[\text{TH1, TL1}]} \quad (\text{Note: } [\text{TH1, TL1}] \text{ must be larger than } 0\text{x}0010)$$

2. When Timer2 is used as baud rate generator:

$$\text{BaudRate} = \frac{f_{\text{sys}}}{[\text{RCAP2H, RCAP2L}]} \quad (\text{Note: } [\text{RCAP2H, RCAP2L}] \text{ must be larger than } 0\text{x}0010)$$

17 SPI/TWI/UART Serial Interface (SSI)

The SC92F836XB integrates SPI/TWI/UART serial interface circuits (SSI), which is convenient for connecting MCU to devices or equipment with different interfaces. The user can configure SSI in any communication mode among SPI, TWI and UART by configuring SSMOD[1: 0] bit of register OTCON. Its features are shown below:

1. SPI mode can be configured as master mode or slave mode
2. TWI mode can only be used as slave in communication
3. UART mode can work in Mode 1 (10-bit full-duplex asynchronous communication) and Mode 3 (11-bit full-duplex asynchronous communication)

Specific configuration modes are shown below:

OTCON (8FH) Output Control Register (Read/Write)

Bit Number	7	6	5	4	3	2	1	0

POR	0	0	0	0	0	0	0	0

Bit Number	Bit Mnemonic	Description
7 ~ 0	SPD[7: 0]	SPI Data Cache Register Data written to SSDAT will be sent to the transmitting shift register. Upon reading SSDAT, data from the receive shift register is received.

17.1.2 Signal Description

Master-Out/Slave-In (MOSI):

This signal connects master device with one slave device. Data is serially transmitted from master device to slave device via MOSI, featuring master device output and slave device input.

Master-In and Slave-Out (MISO):

This signal connects slave device with master device. Data is serially transmitted from slave device to master device via MISO, featuring slave device output and master device input. When SPI is configured as slave device and is not selected, the MISO pin of slave device is in high-impedance state.

SPI Serial Clock (SCK):

SCK signal is used to control synchronous movement of input and output data on MOSI and MISO. Transmit one byte for every 8 clock periods. If no slave device is selected, SCK signal will be ignored from slave device.

17.1.3 Operating Modes

SPI can be configured as master mode or slave mode. The configuration and initialization of SPI module can be completed via setting SSSCON0 register (SPI Control Register) and SSSCON1 (SPI State Register). After completing configuration, data is transmitted by setting SSSCON0, SSSCON1 and SSDAT (SPI Data Register).

During SPI communication period, data is synchronically and serially moved in or out. Serial clock line (SCK) makes data movement and sampling on two serial data lines (MOSI and MISO) keep synchronous. If any slave device is not selected, it is unable to participate in activities on SPI line.

When SPI master device transmits data to slave device via MOSI, slave device sends data to master device via MISO as response, which realizes synchronous full-duplex transmission of data transmitting and receiving at the same clock. The transmit shift register and the receive shift register use the same special function address. Conducting write operations to SPI data register(SSDAT) will write data to the transmit shift register, and conducting read operations to SSDAT will obtain the data from the receive shift register.

The SPI interface of some devices will lead to SS pin (Slave Select, active-low). When communicating with the SC92F836XB SPI, the SS pin from other devices on SPI bus shall be connected based on different communication modes. The following table lists the connection modes of the SS pin from other devices on SPI bus under different communication modes of the SC92F836XB SPI:

SC92F836XB SPI	Other Devices on SPI Bus	Mode	SS of Slave Device (Slave Device Select Pins)
Master Mode	Slave Mode	One Master One Slave	Pull low
		One Master Multiple Slaves	The SC92F836XB leads to multiple I/Os, which respectively connect to the SS pin of slave device. Before data transmission, the SS pin of slave device must be pulled low
Slave Mode	Master Mode	One Master One Slave	Pull high

Master Mode

- **Mode Startup:**

Start of all data transmission on SPI bus is controlled by SPI master device. When MSTR bit in SSSCON0 register is set to 1, SPI operates in master mode, and only one master device can start the transmission.

- **Transmitting:**

In SPI master mode, write one byte of data to SPI data register SSDAT, the data will write to the transmit shift buffer. If any data already exists in the transmit shift register, one WCOL signal will be generated from master SPI to indicate writing is too fast. However, data in the transmit shift register will not be influenced and transmitting will not be interrupted as well. Besides, if the transmit shift register is empty, the master device will move the data in the transmit shift register to MOSI line serially according to SPI clock frequency on SCK. After transmission, SPIF bit in SSSCON1 register will be set to 1. If SPI interrupt is allowed, when SPIF bit is set to 1, an interrupt will be generated as well.

- **Receiving:**

When master device transmits data to slave device via MOSI line, corresponding slave device will also transmit the contents in the transmit shift register to the receive shift register of master device via MISO line so as to realize full-duplex operations. Therefore, setting SPIF flag bit to 1 indicates that transmission is completed and data has been received. Data received from slave device is stored in the receive shift register of master device in accordance with MSB first or LSB first transmission direction. When one byte of data is completely moved to the receive register, the processor can obtain such data by reading SSDAT register.

Slave Mode

- **Mode Startup:**

When the MSTR bit in SSSCON0 register is clear to 0, SPI operates in slave mode.

- **Transmitting and Receiving:**

In slave mode, according to SCK signal controlled by master device, data is moved in via MOSI pin and out via MISO pin. A 1-bit counter records the number of SCK edge. When the receive shift register moves in 8-bit data (one byte) and the transmit shift register moves out 8-bit data (one byte), SPIF flag is set to 1. Data can be obtained by reading SSDAT register. If SPI interrupt is allowed, when setting SPIF to 1, an interrupt will be generated as well. At this time, the receive shift register keeps original data and set SPIF bit to 1, thus SPI slave device will not receive any data until SPIF is cleared to 0. SPI slave device must write the data to be transmitted before master device starts a new data transmission to the transmit shift register. If no data is written before transmitting, slave device will transmit "0x00" bytes to master device. If SSDAT writing operation occurs during the process of transmission, the WCOL flag bit of SPI slave device is set to 1. That is to say, if data is already included in the transmit shift register, WCOL bit of SPI slave device is set to 1, indicating conflict of SSDAT writing. But the data of shift register will not be influenced and transmission will not be interrupted.

17.1.4 Transfer Form

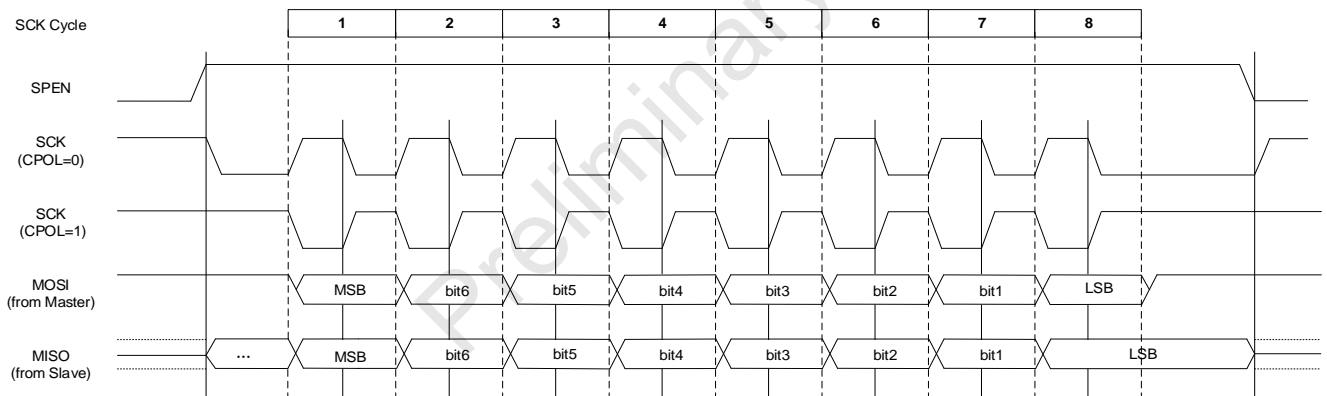

By setting CPOL bit and CPHA bit of SSSCON0 register by software, the user can select four combinations of SPI clock polarity and clock phase. CPOL bit defines the polarity of clock, meaning the level status when idle, which has little influence on SPI transmission format. CPHA bit defines the phase of clock, meaning clock edge allowing data sampling shift. In two devices of master and slave communication, the configuration of clock polarity and phase shall be consistent.

When CPHA = 0, first edge of SCK captures data, and slave device must get the data ready before the first edge of SCK.

CPHA = 0 Data Transmission

When CPHA = 1, master device outputs data to MOSI line at the first edge of SCK, slave device takes the first edge of SCK as the signal of start transmitting and start capturing data at the second edge of SCK. Therefore, user must complete SSDAT writing operation in two edges of first SCK. Such data transmission form is the preferred form of communication between one master device and one slave device.

CPHA = 1 Data Transmission

17.1.5 Error Detection

Writing to SSDAT register may cause conflict during the period of transmitting data sequence, set WCOL bit in SSCON1 register to 1. Setting WCOL bit to 1 will not generate interrupt, and transmitting will not be interrupted. WCOL bit shall be cleared by software.

17.2 Two-Wire Interface (TWI)

SSMOD[1: 0] = 10, SSI is configured as TWI interface. The SC92F836XB can only be used as slave device in TWI communication.

17.2.1 Signal Description
TWI Clock Signal Line (SCL)

This clock signal is sent from master device and connects all slave device. One byte of data is transmitted for every 9 clock periods. First 8 periods are used for data transmission and last one for receiver response clock.

TWI Data Signal Line (SDA)

SDA is a bidirectional signal line, and shall be in high level when idling, which is pulled up by pull-up resistance on SDA line.

17.2.2 Operating Modes

TWI communication of the SC92F836XB has only slave device mode:

- **Mode Startup:**

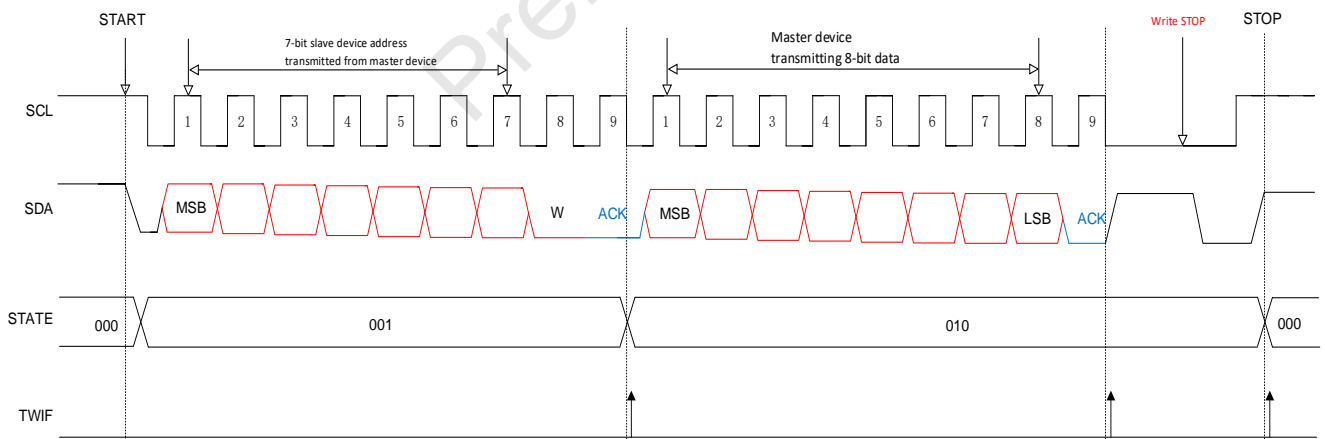

When TWI enabling flag bit opens (TWEN = 1) and receives start-up signal sent from master device, this mode is initiated.

The slave device enters first frame address (STATE[2: 0] = 001) state from idle mode (STATE[2: 0] = 000), and waits for first frame data from master device. First frame data is sent by master device, including 7-bit address bit and 1-bit read and write bit, all slave devices on TWI bus will receive first frame data of master device. After transmitting first frame data, master device will release SDA signal line. If the address sent by master device is the same as the value of address register of slave device, it indicates that the slave device has been selected and the selected slave device will judge to connect the 8th bit on the bus, which is the data read and write bit (=1, reading the command; =0, writing the command), then occupies SDA signal line, after transmitting a low-level response signal at the 9th clock period of SCL, release the bus. After the slave device is selected, enter into different status according to different read and write bits:

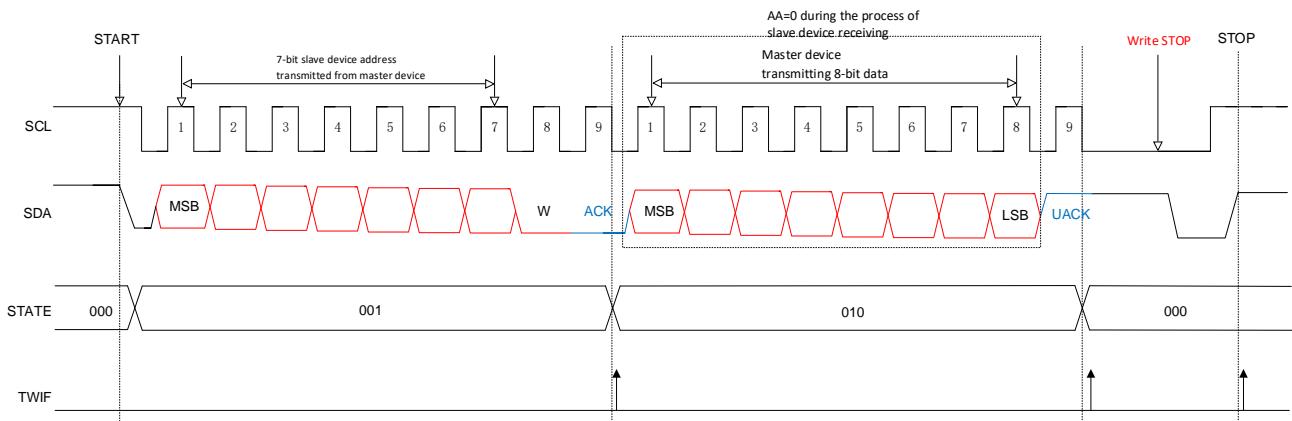

● **Non-general address response, slave device receiving mode:**

If the read and write bit received from the first frame is writing (0), the slave device enters into the receiving state of slave device (STATE [2: 0] = 010), and wait for data sent from receiving master device. Master device will release the bus for transmitting every 8 bits and then wait for the response signal of 9th period of slave device.

1. If the response signal from slave device is in low level, there are three modes of master communication:
 - 1) Continue to send data;
 - 2) Resend start signal, then the slave device enters into the state of receiving first frame address (STATE[2: 0] = 001);
 - 3) Send stopping signal, indicating this transmission is ended, slave device returns to idle state and wait for next start signal from master device.

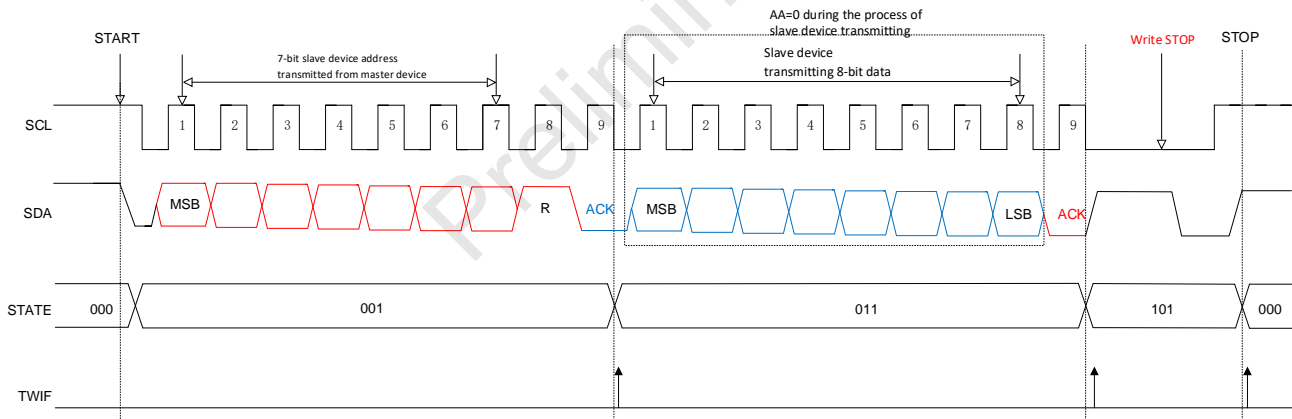

2. If the response state of slave device is in high level (during the receiving process, the value of AA in slave device register is rewritten to 0), it indicates that after transmitting current bytes, the slave device will stop this transmission automatically and return to idle state (STATE[2: 0] = 000), without receiving data sent from master device any more.

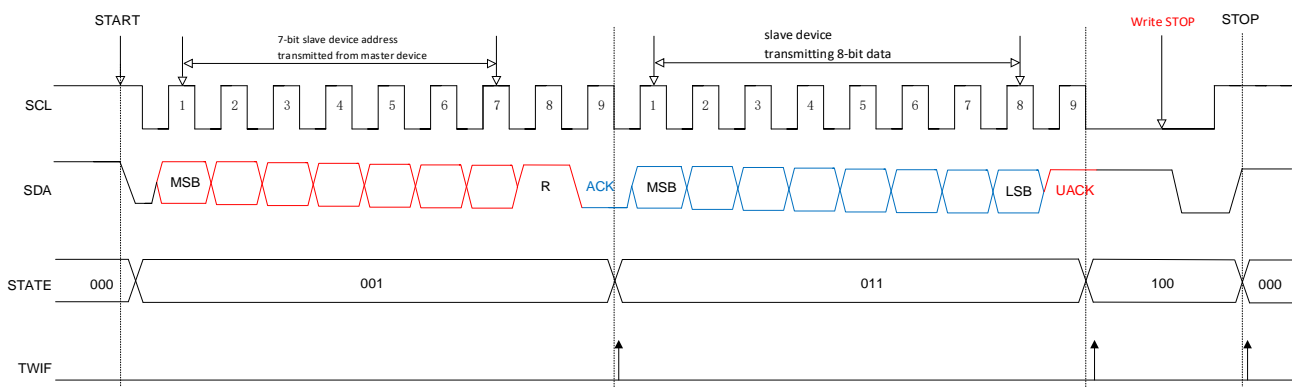

● **Non-general address response, master device transmitting mode:**

If the read and write bit received from the first frame is reading (1), the slave device will occupy the bus and send data to master device. The slave device will release the bus for transmitting every 8-bit data and wait for the response from master device:

1. If the response from master device is low level, the slave device continues to send data. During the transmitting process, if the value of AA in slave device register is rewritten to 0, the slave device will automatically end the transmission and release the bus after transmitting current bytes, and wait for stop signal or restart signal of the master device (STATE[2: 0] = 101).

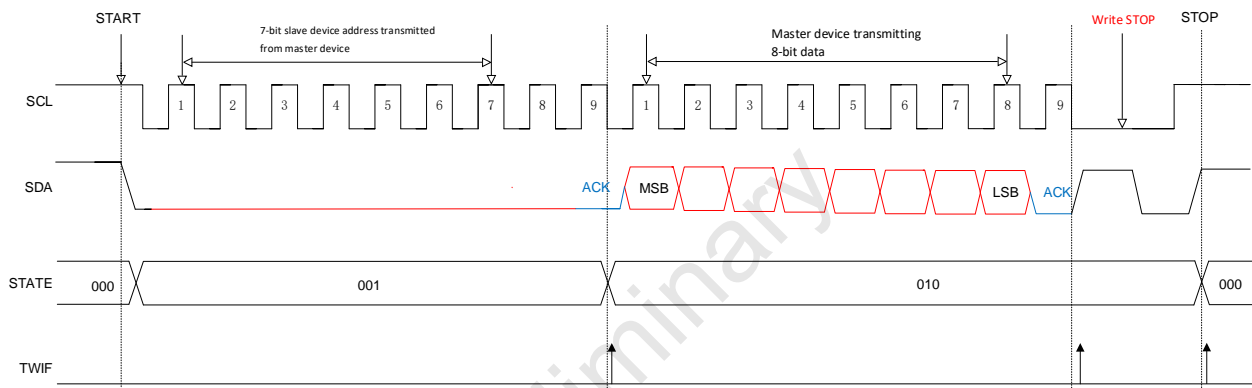

2. If the response from master device is high level, then the slave device state will wait for the stop signal or restart signal of the master device (STATE[2: 0] = 100).

- **Response to General Address:**

When GC=1, general address is allowed to be used. When the slave device enters into the state of receiving first frame address (STATE[2: 0] = 001), the address bit data received in first frame data will be 0x00, at this time, all slave device will respond the master device. The read and write bit sent from master device must be write (0), all slave device will enter into the state of receiving data (STATE[2: 0] = 010). The master device will release SDA line for transmitting every 8-bit data and read the state on SDA line:

1. If any response from slave device occurs, there are three modes of master device communication, as shown below:
 - 1) Continue to transmit data;
 - 2) Restart;
 - 3) Transmit the stop signal and end this communication.

2. If there is no response from slave device, SDA will be in idle state.

Note: When using general address under the mode of one master and multiple slaves, the read and write bit sent by master device can not be read (1) status, or else, all the other devices on the bus will also transmit response except for equipment transmitting data.

17.2.3 Operating Steps

The operating steps of TWI in SSI are shown below:

- ① Configure SSMOD[1: 0] and select TWI mode;
- ② Configure SSSCON0 TWI control register;
- ③ Configure SSSCON1 TWI address register;
- ④ If the slave device receives data, wait for interrupt flag bit TWIF in SSSCON0 to be set. The interrupt flag bit will be set to 1 when the slave device receives every 8-bit data. The interrupt flag bit shall be cleared by the user manually;
- ⑤ If the slave device transmits data, write the data to be transmit into TWDAT, TWI will transmit the data automatically. Interrupt flag bit TWIF will be set to 1 for transmitting every 8 bits.

17.3 Serial Interface 1 (UART1)

SSMOD[1: 0] = 11, SSI is configured as UART interface.

SSCON0 (9DH) Serial Port 1 Control Register (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	SM0	-	SM2	REN	TB8	RB8	TI	RI
R/W	R/W	-	R/W	R/W	R/W	R/W	R/W	R/W
POR	0	x	0	0	0	0	0	0

Bit Number	Bit Mnemonic	Description
7	SM0	<p>Serial Communication Mode Control Bit</p> <p>0: Mode 1, 10-bit full-duplex asynchronous communication composing of 1 starting bit, 8 data bits and 1 stopping bit, with communication baud rate changeable;</p> <p>1: Mode 3, 11-bit full-duplex asynchronous communication, composing of 1 starting bit, 8 data bits and 1 programmable 9th bit and 1 stopping bit, with communication baud rate changeable.</p>
5	SM2	<p>Serial Communication Mode Control Bit 2, this control bit is only valid for mode 3</p> <p>0: Configure RI for receiving each complete data frame to generate interrupt request;</p> <p>1: When receiving a complete data frame and only when RB8=1, will RI be configured to generate interrupt request.</p>
4	REN	<p>Receive Allowing Control Bit</p> <p>0: Receiving data not allowed;</p> <p>1: Receiving data allowed.</p>
3	TB8	Only valid for mode 3, 9 th bit of receiving data

2	RB8	Only valid for mode 3, 9 th bit of receiving data
1	TI	Transmit Interrupt Flag Bit
0	RI	Receive Interrupt Flag Bit
6	-	Reserved

SSCON1 (9EH) Serial Port 1 Baud Rate Control Register Low (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	BAUD1L [7: 0]							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
POR	0	0	0	0	0	0	0	0

SSCON2 (95H) Serial Port 1 Baud Rate Control Register Low (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	BAUD1H [7: 0]							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
POR	0	0	0	0	0	0	0	0

Bit Number	Bit Mnemonic	Description
7 ~ 0	BAUD1 [15: 0]	Serial Port Baud Rate Control Bit $\text{BaudRate} = \frac{f_{\text{sys}}}{\text{BAUD1H, BAUD1L}}$

		Note: [BAUD1H, BAUD1L] must be larger than 0x0010
--	--	---------------------------------------------------

SSDAT (9FH) Serial Port Data Cache Register (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	SBUF[7: 0]							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
POR	0	0	0	0	0	0	0	0

Bit Number	Bit Mnemonic	Description
7 ~ 0	SBUF[7: 0]	Serial Data Buffer SBUF contains two registers: one for transmit shift register and one for receiving latch, data writing to SBUF will be sent to shift register and initiate transmitting process, reading SBUF1 will return the contents of receiving latch.

18 Analog-to-Digital Converter (ADC)

The SC92F836XB has a 12-bit high-precision successive approximation ADC with 11-channel, the external 10 ADC channel is multiplexing with other IO ports. Cooperating with the internal 2.4V reference voltage, one internal channel connected to $1/4 V_{DD}$ can be used for measuring V_{DD} voltage.

There are 2 options for ADC reference voltage:

- ① V_{DD} pin (internal V_{DD});
- ② Precise 2.4V reference output from internal Regulator (at this time, MCU supply voltage V_{DD} can not be lower than 2.9V).

Note: The clock source of ADC circuit is fixed as $f_{HRC} = 24\text{MHz}$, which will not change with the switch of internal and external system clocks.

18.1 ADC-related Registers

ADCCON (ADH) ADC Control Register (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	ADCEN	ADCS	EOC/ADCIF	ADCIS[4: 0]				
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
POR	0	0	0	0	0	0	0	n

Bit Number	Bit Mnemonic	Description
7	ADCEN	ADC Power Control Bit 0: Disable ADC module power 1: Enable ADC module power
6	ADCS	ADC Start Trigger Control Bit (ADC Start) Write "1" for this bit, an ADC conversion started, this bit is the trigger signal only for ADC switch. This bit is valid only for writing "1". Note: After writing "1" to ADCS, do not write to the ADCCON register until the interrupt flag EOC/ADCIF is set.

5	EOC /ADCIF	<p>End Of Conversion / ADC Interrupt Flag</p> <p>0: Conversion not completed</p> <p>1: ADC conversion completed and need the user cleared up by software.</p> <p>ADC conversion completion flag EOC: when the user sets up ADCS for conversions, this bit will be cleared to 0 by hardware automatically; after completing conversion, this bit will be configured to 1 automatically by hardware;</p> <p>ADC interrupt request flag ADCIF: this bit is also used as interrupt request flag of ADC interrupt. If ADC interrupt is enabled, this bit must be cleared by the user with software after ADC interrupt generated.</p>
4 ~ 0	ADCIS[4: 0]	<p>ADC Input Selection Bits</p> <p>00000: Select AIN0 as ADC input</p> <p>00001: Select AIN1 as ADC input</p> <p>00010: Select AIN2 as ADC input</p> <p>00011: Select AIN3 as ADC input</p> <p>00100: Select AIN4 as ADC input</p> <p>00101: Select AIN5 as ADC input</p> <p>00110: Select AIN6 as ADC input</p> <p>00111: Select AIN7 as ADC input</p> <p>01000: Select AIN8 as ADC input</p> <p>01001: Select AIN9 as ADC input</p> <p>01010 ~ 11110: Reserved</p> <p>11111: ADC input is 1/4 V_{DD}, used for measuring power voltage</p>

ADCCFG2 (AAH) ADC Configuration Register 2 (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	-	-	-	-	LOWSP	ADCCCK[2: 0]		
R/W	-	-	-	-	R/W	R/W	R/W	R/W

POR	x	x	x	x	0	0	0	0
-----	---	---	---	---	---	---	---	---

Bit Number	Bit Mnemonic	Description
3	LOWSP	<p>ADC Sampling Clock Frequency Selector</p> <p>0: Configure ADC sampling time as 6 ADC sampling clock periods</p> <p>1: Configure ADC sampling time as 36 ADC sampling clock periods</p> <p>LOWSP controls ADC sampling clock frequency, conversion clock frequency of ADC is controlled by ADCCK[2: 0], independent of the influence of LOWSP bit</p> <p>The whole process from sampling to conversion of ADC needs 6 or 36 ADC sampling clocks plus 14 ADC conversion clocks, therefore, in practical application, the total time of ADC from sampling to conversion shall be calculated as follows:</p> <p>LOWSP=0: $T_{ADC1} = (6+14)/f_{ADC}$;</p> <p>LOWSP=1: $T_{ADC2} = (36+14)/f_{ADC}$</p>
2 ~ 0	ADCCK[2: 0]	<p>ADC Sampling Clock Frequency Selector</p> <p>000: Configure ADC clock frequency f_{ADC} as $f_{HRC}/32$;</p> <p>001: Configure ADC clock frequency f_{ADC} as $f_{HRC}/24$;</p> <p>010: Configure ADC clock frequency f_{ADC} as $f_{HRC}/16$;</p> <p>011: Configure ADC clock frequency f_{ADC} as $f_{HRC}/12$;</p> <p>100: Configure ADC clock frequency f_{ADC} as $f_{HRC}/8$;</p> <p>101: Configure ADC clock frequency f_{ADC} as $f_{HRC}/6$;</p> <p>110: Configure ADC clock frequency f_{ADC} as $f_{HRC}/4$;</p> <p>111: Configure ADC clock frequency f_{ADC} as $f_{HRC}/3$;</p> <p>Note: The clock source of the ADC circuit is fixed as $f_{HRC} = 24MHz$ and will not change with the switch of the internal and external system clocks.</p>
7 ~ 4	-	Reserved

ADCCFG0 (ABH) ADC Configuration Register 0 (Read/Write)

11 ~ 4	ADCV[11: 4]	ADC conversion value high byte values
3 ~ 0	ADCV[3: 0]	ADC conversion value low 4-bit values

IE (A8H) Interrupt Enable Register (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	EA	EADC	ET2	-	ET1	EINT1	ET0	EINT0
R/W	R/W	R/W	R/W	-	R/W	R/W	R/W	R/W
POR	0	0	0	x	0	0	0	0

Bit Number	Bit Mnemonic	Description
6	EADC	ADC Interrupt Enable Control Bit 0: EOC/ADCIF interrupt not allowed 1: EOC/ADCIF interrupt allowed

IP (B8H) Interrupt Priority Control Register (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	-	IPADC	IPT2	-	IPT1	IPINT1	IPT0	IPINT0
R/W	-	R/W	R/W	-	R/W	R/W	R/W	R/W
POR	x	0	0	x	0	0	0	0

Bit Number	Bit Mnemonic	Description
6	IPADC	ADC Interruption Priority Selection Bit 0: Set the interrupt priority of ADC to be "low" 1: Set the interrupt priority of ADC to be "high"

18.2 ADC Conversion Steps

Operating steps for the user to practically conduct ADC conversion are shown below:

- ① Configure ADC input pin; (configure corresponding bit of AINx as ADC input, in general, ADC pin will be prefixed);
- ② Configure ADC reference voltage Vref and ADC conversion frequency;
- ③ Enable ADC;
- ④ Select ADC input channel; (Configure ADCIS bit and select ADC input channel);
- ⑤ Enable ADCS, and start conversion;
- ⑥ Wait for EOC/ADCIF=1, if ADC interrupt is enabled, ADC interrupt will be generated and the user shall clear EOC/ADCIF flag to 0 by software;
- ⑦ Obtain 12-bit data from ADCVH, ADCVL from high bit to low bit, and complete a conversion
- ⑧ If no change in input channel, repeat Step 5 to Step 7 for next conversion.

Note: Before setting up IE[6] (EADC), it is recommended for the user to use software to clear the EOC/ADCIF flag first. After completing ADC interrupt service process, user shall eliminate EOC/ADCIF to avoid generating ADC interrupt constantly.

19 Dual-mode TouchKey Module

The SC92F836XB is equipped with a built-in dual-mode capsense TouchKey circuit with 23-channel, which is configured as high-sensitivity mode or high-reliability mode, its features are shown below:

1. High-sensitivity mode can be applied to TouchKey application featuring high sensitivity requirements including TouchKey sensor, proximity sensing, etc
2. High-reliability mode features strong anti-interference capability which can pass 10V dynamic CS testing.
3. Realize 23-channel TouchKey sensors and derivative functions
4. High-flexibility development software library is provided for support with low development difficulty
5. Automatic debugging software is provided for support and featuring intelligent development
6. TouchKey module can operate in low-consumption mode under MCU STOP mode, when adopting single TouchKey to wake up STOP, the overall power consumption can be as low as 11uA.

Note: The clock source of the dual-mode TouchKey circuit is fixed as $f_{HRC} = 24\text{MHz}$, and it will not change with the conversion of internal and external system clock.

19.1 Power Saving Modes of TouchKey Module

The SC92F836XB allows TouchKey scan function in STOP Mode, which can reduce the overall power consumption of MCU and satisfy the TouchKey application with low power consumption requirements.

There is two power consumption modes of the SC92F836XB TouchKey circuit:

1. Normal Run Mode
2. Low Consumption Run Mode

The definitions of these two power consumption modes are shown as follows:

Description	Normal Run Mode	Low Power Consumption Run Mode
CPU	RUN (Normal mode)	Stop (STOP Mode)
TouchKey circuit	RUN	RUN

19.2 TouchKey Mode

The SC92F836XB dual-mode TouchKey circuit provides two TouchKey modes:

1. High-sensitivity Mode
2. High-Reliability Model

The user can select TouchKey mode and realize all TouchKey functions quickly and simply by using TouchKey library documents provided by SinOne (available from SinOne website).

The user can select the most appropriate TouchKey mode for current application according the following table:

Description	High-sensitivity Mode	High-Reliability Mode
Features	<ol style="list-style-type: none"> ① High anti-jamming capability, can pass 3V dynamic CS test ② Super- high sensitivity 	<ol style="list-style-type: none"> ① Super anti-jamming capability, can pass 10V dynamic CS test ② Lower power consumption
Applications	<ol style="list-style-type: none"> ① General TouchKey application ② TouchKey sensor application ③ Proximity sensing application ④ TouchKey application featuring high sensitivity requirements 	<ol style="list-style-type: none"> ① Applications featuring super-high anti-interference ② Application with 10V Dynamic CS Requirements
Access Mode	Load high-sensitivity TouchKey library by project engineering to select high-sensitivity mode	Load high-reliability TouchKey library by project engineering to select high-reliability mode
Documentation	<p>《TouchKey MCU Application Guide of SC92F_93F Series》</p> <p>Relevant chapters:</p> <ul style="list-style-type: none"> ● 2 SC92F8XXX_SC93F8XXX_HIGHSENSITIVE_LIB_T1 Library specification ● 3 SC92F8XXX_SC93F8XXX_HIGHSENSITIVE_LIB_T2 Library specification 	<p>《TouchKey MCU Application Guide of SC92F_93F Series》</p> <p>Relevant chapters:</p> <ul style="list-style-type: none"> ● 4 SC92F8XXX_SC93F8XXX_HIGHSENSITIVE_LIB_T1 Library specification
Corresponding Library Document	SC92F8X6XB_HighSensitive_Lib_Tn_Vx.x.x.LIB	SC92F8X6XB_HighReliability_Lib_Tn_Vx.x.x.LIB

Notes	① T1 library applies to spring-type application ② T2 library applies to sensor type application with push buttons more than 3	Only apply to spring-type application
Selection Function	In general, it is recommended to use this high sensitivity mode to obtain better using experience.	Only under two circumstances, it is recommended to use high-reliability mode: ① It is required to use 10V dynamic CS ② It requires lower power consumption current and the current under high sensitivity mode can not meet the requirement.

20 EEPROM and IAP Operations

There are two options for the SC92F836XB IAP operating scope:

EEPROM and IAP operating modes are shown below:

1. Internal highest address 128 bytes EEPROM can be used as data storage;
2. The whole 8K bytes of IC ROM and 128 bytes of EEPROM can be used for IAP operations, which is mainly used for remote program updating.

Note: The number of erasure of EEPROM is 100,000 times. The user should not exceed the rated burn number of EEPROM, otherwise there will be an exception!

As Code Option, the user shall select IAP operating space before it is written to IC by programmer:

OP_CTM1 (C2H@FFH) Customer Option Register 1 (Read/Write)

Bit number	7	6	5	4	3	2	1	0

Bit Number	Bit Mnemonic	Description
3 ~ 2	PAYTIMES[1: 0]	Upon EEPROM/IAP writing operation, CPU Hold Time length configuration 00: Configure CPU HOLD TIME 4mS@12/6/2 MHz 01: Configure CPU HOLD TIME 2mS@12/6/2 MHz 10: Configure CPU HOLD TIME 1mS@12/6/2 MHz 11: Reserved

		<p>Notes: The CPU Hold is for PC pointer, other functional module continues to work; interrupt flag is saved, and interrupt is generated after completing Hold, but several times of interrupt can only be saved once.</p> <p>Recommended Selection: 2.7V ~ 5.5 V for V_{DD}, 10 is available 2.4V ~ 5.5V for V_{DD}, 01 or 00 is available</p>
1 ~ 0	CMD[1: 0]	<p>EEPROM / IAP writing operating command</p> <p>10: Write</p> <p>Other: Reserved</p> <p>Note: The statement of EEPROM/IAP write operation shall be followed by at least 8 NOP instructions to guarantee subsequent instruction can be implemented normally after finishing IAP operation!</p>

20.2 EEPROM / IAP Operating Procedures:

Writing procedure of the SC92F836XB EEPROM/IAP are shown below:

- ① Write 0x00 into IAPADE[7: 0]: select Code memory and conduct IAP operation; write 0x02 into IAPADE[7: 0]: select EEPROM and conduct EEPROM reading and writing operations;
- ② Write data into IAPDAT[7: 0] (data for EEPROM / IAP writing ready);
- ③ Write address into {IAPADR[12: 8], IAPADR[7: 0]} (target address of EEPROM/IAP operation ready);
- ④ Write a nonzero value n into IAPKEY[7: 0] (switch on protection of EEPROM / IAP, and EEPROM / IAP function will be switched off when there is no writing command within n system clocks);
- ⑤ Write CPU Hold time into IAPCTL[3: 0] (configure CPU Hold time by setting CMD[1: 0] to 1 or 0, CPU is Hold up and start up EEPROM/IAP writing);
- ⑥ EEPROM/IAP writing ends, CPU proceeds to subsequent operations.

Notes:

1. When programming IC, if “Code memory Prohibits IAP Operations” is selected by Code Option, IAP is unavailable upon IAPADE[7: 0]=0x00 (Select Code memory), meaning it is unable to write data, and such data can only be read by MOVC command.
2. When IAPADE=0x01 or 0x02, MOVC instruction and writing operation are conducted in EEPROM or IFB data memory. If any interrupt occurs and there are also MOVC operations in this interrupt, it may result in error of MOVC operations and thus abnormal operation of program. To avoid such situation, the user shall disable global interrupt control bit (EA=0) before conducting IAPADE=0x01 or 0x02 operations. After operation completed, configure IAPADE =0x00 and enable global interrupt control bit (EA=1).

20.2.1 128 bytes Independent EEPROM Operating Demo program

```
#include "intrins.h"

unsigned char EE_Add;

unsigned char EE_Data;

unsigned char code * POINT =0x0000;
```

C Demo Program of EEPROM Write Operation:

```
EA = 0;                // Disable global Interrupt

IAPADE = 0x02;         //Select EEPROM data memory

IAPDAT = EE_Data;     //Transmit data to EEPROM data register

IAPADH = 0x00;        //High-bit address default write 0x00

IAPADL = EE_Add;      //Write EEPROM target address low bit

IAPKEY = 0xF0;        //This value can be adjusted as required: it shall guarantee that

                        // The time interval between this instruction implemented and writing
                        // IAPCTL value shall be less than 240 (0xf0) system clocks, or else, IAP function
                        // is closed;

                        //Pay special attention to enabling interrupt;

IAPCTL = 0x0A;        //Implement EEPROM write operation, 1ms@12/6/2 MHz;

C Demo Program of IAP Read Operation:

```
IAPADE = 0x00;           //Select Code memory
IAP_Data = * ( POINT+IAP_Add); //Read value in IAP_Add to IAP_Data
```

Note: IAP operation in 8K bytes Code memory has certain risks, the user shall implement corresponding safety measures in software. Incorrect operation may result in the user program to be rewritten! Unless such function is required by the user (such as used for remote program update, etc.), it is not recommended to be used by the user.

21 CheckSum Module

The SC92F836XB is equipped with a check sum module, which is used for generating 16-bit check sum of code memory in real time. The user can compare such check sum with theoretical value to monitor whether the contents in code memory are correct.

Note: Check sum is the sum of data in the whole code memory, which is the data of 0000H ~ 1FFDH address unit. If there are residual values from the user's last operations in address unit, it may result in inconsistency of check sum with theoretical value. Therefore, it is recommended that the user shall erase the whole Code memory or write 0 before programming code so as to guarantee the consistency between check sum and theoretical value.

21.1 CheckSum-Related Registers

CHKSUML (FCH) Check Sum Result Register Low Bit (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	CHKSUML[7: 0]							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
POR	0	0	0	0	0	0	0	0

Bit Number	Bit Mnemonic	Description
7 ~ 0	CHKSUML [7: 0]	CheckSum Result Register Low Bit

CHKSUMH (FDH) Check Sum Result Register High Bit (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	CHKSUMH[7: 0]							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
POR	0	0	0	0	0	0	0	0

Bit Number	Bit Mnemonic	Description
7 ~ 0	CHKSUMH [7: 0]	CheckSum Result Register High Bit

OPERCON (EFH) Arithmetic Control Register (Read/Write)

Bit Number	7	6	5	4	3	2	1	0
Bit Mnemonic	-	-	-	-	-	-	-	CHKSUMS
R/W	-	-	-	-	-	-	-	R/W
POR	x	x	x	x	x	x	x	0

Bit Number	Bit Mnemonic	Description
0	CHKSUMS	CheckSum Operation Starts Trigger Control Bit (Start) Write "1" for this bit, start to conduct Check sum calculation. This bit is valid for only writing 1.

22 Electrical Characteristics

22.1 Absolute Maximum Ratings

Symbol	Parameter	Min Value	Max Value	Unit
VDD/VSS	DC supply voltage	-0.3	5.5	V
Voltage ON any Pin	Input/output voltage of any pin	-0.3	V _{DD} +0.3	V
T _A	Ambient temperature	-40	85	°C
T _{STG}	Storage temperature	-55	125	°C

22.2 Recommended Operating Conditions

Symbol	Parameter	Min Value	Max Value	Unit	System Clock Frequency
V _{DD1}	Operating voltage	2.9	5.5	V	>12MHz
V _{DD2}	Operating voltage	2.4	5.5	V	≤12MHz
T _A	Ambient temperature	-40	85	°C	-

22.3 DC Characteristics

(V_{DD} = 5V, T_A = +25°C, unless otherwise specified)

Symbol	Parameter	Min Value	Typical Value	Max Value	Unit	Testing Conditions
Current
